## 4. INTRODUCTION

Soil Salinity Research Institute, Pindi Bhattian was established in 1982-83 for conducting research to devise ways and means and proper technologies for economic utilization of salt affected soils and scientific use of brackish sub-soil water for agricultural purposes in the Punjab. The past work on salinity/sodicity was evaluated and found many deficiencies in the field. Many projects were launched to cover up such deficiencies. Since its establishment, many useful technologies have been developed for economic utilization of salt affected soils and brackish water and efforts are being made to achieve the objectives stated below:

1. Development of technology for reclamation of salt affected soil
2. Development of technology for management of brackish water
3. Development of crop production technology for salt affected soil
4. Management of plant Nutrition in salt affected soil
5. Screening of varieties of crops / fruit plants against Salinity/ sodicity
6. Advisory service to the farmers.

The scientists of the institute have got published 205 Research Articles on various aspects of soil salinity and sub-soil brackish water management in scientific journals of national and international repute. Ph.D. level research is also conducted at this institute. The results of research experiments are regularly being disseminated through radio talks in agricultural broadcasts of radio Pakistan Lahore and Faisalabad as well as publication through Ziraat Nama etc. Brochures in Urdu on different aspects are published and distributed free of cost to the farming community. Moreover, the electronic and print media are being utilized for dissemination and popularization of research findings / technologies developed.

The institute is comprised of seven divisions namely Soil Reclamation, Water Quality, Plant Nutrition, Soil Physics, Agronomy, Economic Botany and Agricultural Engineering. Each division is conducting its own experiments in Rabi and Kharif seasons to solve the problems of salt affected areas. The results are being presented in this report.

### 5.0 RESREACH WORK

### 5.1 SOIL PHYSICS Division

## 1. LONG TERM EFFECT OF HIGH RSC WATER ON PHYSICAL PROPERTIES OF SOIL UNDER RICE-MUSTARD ROTATION

The experiment was designed in 2013 to study the deleterious effect of high RSC water on soil physical properties under rice-mustard (Raya) crop rotation. A moderately salt affected field $\left(\mathrm{pH}_{\mathrm{s}}=8.82, \mathrm{EC}_{\mathrm{e}}=4.71 \mathrm{dS} \mathrm{m}^{-1}, \mathrm{SAR}=26.82\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}, \mathrm{HC}=0.67 \mathrm{~cm} \mathrm{hr}^{-1}\right.$ and $\mathrm{BD}=$ $1.37 \mathrm{Mg} \mathrm{m}^{-3}$ was selected, prepared and leveled. Composite soil samples were collected and analyzed for salinity/sodicity and gypsum requirement. Experiment was laid out in RCBD with three replications. Tube-well water (EC $1.37 \mathrm{dS} \mathrm{m}^{-1}$, SAR $8.40\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ and RSC ( 7.85 me $\mathrm{L}^{-1}$ ) was used for irrigation. Gypsum and $\mathrm{H}_{2} \mathrm{SO}_{4}$ was applied on the basis of RSC of water with respect to number of irrigation. Guar was sown on 29-05-2019 and incorporated in soil before flowering. FYM was applied 15 days before transplanting of rice. The rice variety PS2 was transplanted on 15-07-2019. Recommended dose of fertilizers ( $150-90-60 \mathrm{NPK} \mathrm{kg} \mathrm{ha}{ }^{-1}$ ) was applied to rice. All the phosphorus and potassium was applied at transplanting, while nitrogen ( N ) was applied in three splits. All agronomic and plant protection practices were kept constant. The crop was harvested at maturity. Soil samples were collected after harvesting of crop. Paddy yield data was recorded at maturity. The treatments tested along with paddy yield is as under.

Table 1: Effect of treatments on paddy yield (t. ha ${ }^{-1}$ ) 2019

| Treatments | Paddy Yield <br> (t. $\mathbf{h a}^{\mathbf{- 1}}$ ) |
| :--- | :---: |
| $\mathrm{T}_{1}$ Tube well water | 3.20 C |
| $\mathrm{T}_{2}$ Gypsum application on the basis of RSC of water | 3.90 A |
| $\mathrm{~T}_{3} \mathrm{H}_{2} \mathrm{SO}_{4}$ application on the basis of RSC of water | 3.83 A |
| $\mathrm{~T}_{4}$ Green Manuring with Guar | 3.57 B |
| $\mathrm{~T}_{5} \mathrm{FYM}$ @ 10 t. ha $^{-1}$ | 3.62 B |
| LSD | 0.2342 |

Data presented in Table-1 revealed that paddy yield was significantly higher in $\mathrm{T}_{2}$ (gypsum application on the basis of RSC of water) and $\mathrm{T}_{3}\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right.$ application on the basis of RSC of water) followed by FYM @ $10 \mathrm{t} . \mathrm{ha}^{-1}$ and green manuring with Guar.The lowest yield was recorded in control $\left(\mathrm{T}_{1}\right)$.

Table 2: Soil analyses after rice harvest 2019

| Treatments | pH ${ }_{\text {s }}$ | $\begin{aligned} & \mathbf{E C}_{\mathbf{e}} \\ & \left(\mathrm{dS} \mathrm{~m}^{-1}\right) \end{aligned}$ | $\begin{aligned} & \text { SAR } \\ & \left(\mathrm{mmol} \mathrm{~L}^{-1}\right)^{1 / 2} \end{aligned}$ | HC <br> $\left(\mathrm{cm} \mathrm{hr}^{-1}\right)$ | $\begin{aligned} & \mathbf{B D} \\ & \left(\mathrm{Mg} \mathrm{~m}^{-3}\right) \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ Tube well water | 8.91 | 4.73 | 31.20 | 0.59 | 1.46 |
| $\mathrm{T}_{2}$ Gypsum application on the basis of RSC of water | 8.40 | 3.29 | 13.50 | 0.79 | 1.21 |
| $\mathrm{T}_{3} \mathrm{H}_{2} \mathrm{SO}_{4}$ application on the basis of RSC of water | 8.44 | 3.69 | 14.80 | 0.74 | 1.24 |
| $\mathrm{T}_{4}$ Green Manuring with Guar | 8.60 | 3.76 | 16.80 | 0.72 | 1.26 |
| T ${ }_{5}$ FYM @ 10 t. ha $^{-1}$ | 8.61 | 3.80 | 15.90 | 0.71 | 1.25 |

Soil analysis after rice harvest (Table 2) revealed that $\mathrm{pH}_{s}$ was above the safe limits in all the treatments except in $T_{2}$ and SAR was above the safe limit in $\mathrm{T}_{1} . \mathrm{EC}_{\mathrm{e}}$ was above the safe limit only in $\mathrm{T}_{1}$ (control). Hydraulic conductivity of soil increased in all the treatments as compared to control. However, bulk density decreased in all the treatments when compared with control and minimum BD was recorded where gypsum was applied on the basis of RSC of water.

In the same layout raya crop was sown on 14-11-2019 after harvesting of rice and fertilizer was applied @ 70-70-60 NPK $\mathrm{kg} \mathrm{ha}^{-1}$. All the phosphorus and potassium were applied as basal, while N was applied in splits. All agronomic and plant protection practices were applied uniformly. Yield data of raya was recorded at maturity.

Table 3: Effect of treatments on raya yield 2019-20

| Treatments | Grain Yield <br> (t. ha $\left.{ }^{-1}\right)$ |
| :--- | :--- |
| $\mathrm{T}_{1}$ Tube well water | 1.02 C |
| $\mathrm{T}_{2}$ Gypsum application on the basis of RSC of water | 1.72 A |
| $\mathrm{~T}_{3} \mathrm{H}_{2} \mathrm{SO}_{4}$ application on the basis of RSC of water | 1.70 A |
| $\mathrm{~T}_{4}$ Green Manuring with Guar | 1.37 B |
| $\mathrm{~T}_{5} \mathrm{FYM}$ @ $10 \mathrm{t} . \mathrm{ha}^{-1}$ | 1.40 B |
| LSD | 0.1474 |

Results presented in Table 3 revealed that grain yield of raya remained at par in $T_{2}$ (Gypsum application on the basis of RSC of water) and $\mathrm{T}_{3}\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right.$ application on the basis of RSC of water) followed by FYM @ 10 t . ha ${ }^{-1}$ and green manuring with guar. Lowest grain yield was recorded in control.

Table 4: Soil Analysis after harvesting of Raya 2019-20

| Treatments | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | $\mathbf{H C}$ <br> $\left(\mathrm{cm} \mathrm{hr}^{-1}\right)$ | $\mathbf{B D}$ <br> $\left(\mathrm{Mg} \mathrm{m}^{-3}\right)$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ Tube well water | 8.92 | 4.72 | 31.70 | 0.58 | 1.46 |
| $\mathrm{T}_{2}$ Gypsum application on the basis of <br> RSC of water | 8.37 | 3.25 | 12.90 | 0.80 | 1.20 |
| $\mathrm{T}_{3} \mathrm{H}_{2} \mathrm{SO}_{4}$ application on the basis of <br> RSC of water | 8.40 | 3.66 | 14.30 | 0.75 | 1.23 |
| $\mathrm{~T}_{4}$ Green Manuring with Guar | 8.57 | 3.73 | 15.90 | 0.72 | 1.25 |
| $\mathrm{~T}_{5}$ FYM @ 10 t. ha ${ }^{-1}$ | 8.58 | 3.78 | 14.70 | 0.71 | 1.24 |

Soil analysis after harvesting of raya (Table 4) showed that $\mathrm{pH}_{\mathrm{s}}$ was above the safe limit in $\mathrm{T}_{1}$ (tube well water), $\mathrm{T}_{4}$ (Green Manuring with Guar) and $\mathrm{T}_{5}$ (FYM @ 10 t . ha ${ }^{-1}$ ) while $\mathrm{EC}_{\mathrm{e}}$ and SAR were above the safe limit in $\mathrm{T}_{1}$ (tube well water) only. Hydraulic conductivity of soil increased and bulk density decreased in all the treatments when compared with control and minimum bulk density was recorded in $\mathrm{T}_{2}$ (gypsum application on the basis of RSC of tube well water).

## 2. INTEGRATED USE OF SULPHUR AND ORGANIC AMENDMENT FOR RECLAMATION OF SALINE SODIC SOIL IN WHEAT-PEARL MILLET ROTATION

The experiment was designed in 2016 to study the effectiveness of combined use of sulphur and press mud for reclamation of saline sodic soil in wheat-pearl millet rotation. A salt affected field $\left\{\mathrm{pH}_{s}=8.97, \mathrm{EC}_{\mathrm{e}}=4.52 \mathrm{dS} \mathrm{m}\right.$, $\mathrm{SAR}=40.70\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}, \mathrm{HC}=0.40 \mathrm{~cm} \mathrm{hr}^{-1}$ and $\mathrm{BD}=1.68 \mathrm{Mg} \mathrm{m}^{-3}$ and $\left.\mathrm{GR}=2.50\left(\mathrm{t} . \mathrm{acre}^{-1}\right)\right\}$ was selected, prepared and leveled. Composite soil samples were collected and analyzed for salinity/sodicity. Experiment was laid out in RCBD with three replications. Sulfur was applied on the basis of $25 \%, 50 \%$ and $100 \%$ of gypsum requirement alone and in combination with press mud according to the treatment plan. Press mud was applied @ 20 tons per hectare alone and @ 15 and 10 tons per hectare in combination with sulphur. Sulphur was applied 30 days and press mud was applied 15 days before sowing followed by flooding. All the treatments were applied at the start of study. After the harvest of wheat 2018-19, pearl millet variety Pioneer was sown in lines by rabi drill. Recommended dose of fertilizers @ 80-60-60 NPK $\mathrm{kg} \mathrm{ha}^{-1}$ was applied. All the phosphorus and potassium was applied at sowing while N was applied in splits. Recommended agronomic and plant protection practices were kept constant. Yield data of pearl millet was recorded at maturity.

Table 5: Effect of Sulphur and press mud on grain yield of pearl millet (2019)

| Treatments | Grain Yield <br> (t. $\left.\mathrm{ha}^{-1}\right)$ |
| :--- | :---: |
| $\mathrm{T}_{1}$ Control | 1.26 D |
| $\mathrm{T}_{2}$ Sulphur on the basis of $50 \% \mathrm{GR}$ | 1.36 CD |
| $\mathrm{T}_{3}$ Sulphur on the basis of $100 \% \mathrm{GR}$ | 1.38 CD |
| $\mathrm{T}_{4}$ Press mud @ 20 t ha ${ }^{-1}$ | 1.62 A |
| $\mathrm{~T}_{5}$ Sulphur on the basis of $50 \% \mathrm{GR}+$ Press mud @ $10 \mathrm{t} \mathrm{ha}^{-1}$ | 1.51 AB |
| $\mathrm{T}_{6}$ Sulphur on the basis of $25 \% \mathrm{GR}+$ Press mud @ $15 \mathrm{t} \mathrm{ha}^{-1}$ | 1.45 BC |
| LSD | 0.1298 |

Results in Table 5 revealed that grain yield of pearl millet was non-significant in $\mathrm{T}_{4}$ (Press mud @ $20 \mathrm{tha}{ }^{-1}$ ), $\mathrm{T}_{5}$ (Sulphur on the basis of $50 \% \mathrm{GR}+$ Press mud @ $10 \mathrm{tha}{ }^{-1}$ ) and $\mathrm{T}_{6}$ (Sulphur on the basis of $25 \% \mathrm{GR}$ + Press mud @ $15 \mathrm{tha}^{-1}$ ). Lowest grain yield was obtained from $\mathrm{T}_{1}$ (Control).

Table 6: Soil Analysis after harvesting of pearl millet 2019

| Treatments | pH ${ }_{\text {s }}$ | $\begin{gathered} \mathbf{E C}_{\mathbf{e}} \\ \left(\mathrm{dS} \mathrm{~m}^{-1}\right) \end{gathered}$ | $\begin{gathered} \text { SAR } \\ \left(\mathrm{mmol} \mathrm{~L}^{-1}\right)^{1 / 2} \end{gathered}$ | $\begin{gathered} \mathbf{H C} \\ \left(\mathrm{cm} \mathrm{hr}^{-1}\right) \end{gathered}$ | $\begin{gathered} \text { BD } \\ \left(\mathrm{Mg} \mathrm{~m}^{-3}\right) \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| T ${ }_{1}$ Control | 8.87 | 4.29 | 33.30 | 0.40 | 1.67 |
| $\mathrm{T}_{2}$ Sulphur on the basis of $50 \% \mathrm{GR}$ | 8.39 | 4.10 | 25.36 | 0.46 | 1.64 |
| $\mathrm{T}_{3}$ Sulphur on the basis of $100 \%$ GR | 8.00 | 3.90 | 23.30 | 0.50 | 1.61 |
| $\mathrm{T}_{4}$ Press mud @ 20 t ha ${ }^{-1}$ | 8.65 | 3.92 | 22.20 | 0.49 | 1.60 |
| $\mathrm{T}_{5}$ Sulphur on the basis of $50 \%$ GR + Press mud @ 10 tha $^{-1}$ | 8.64 | 3.98 | 24.90 | 0.48 | 1.63 |
| $\mathrm{T}_{6}$ Sulphur on the basis of $25 \% \mathrm{GR}+$ Press mud @ $15 \mathrm{t} \mathrm{ha}^{-1}$ | 8.60 | 3.99 | 23.60 | 0.48 | 1.62 |

Soil analysis after pearl millet showed that (Table 6) showed that $\mathrm{pH}_{\mathrm{s}}$ was above the safe limits in all the treatments except in $\mathrm{T}_{3}$ (Sulphur on the basis of $100 \% \mathrm{GR}$ ) and $\mathrm{T}_{2}$ (Sulphur on the basis of $50 \% \mathrm{GR}$ ). $\mathrm{EC}_{\mathrm{e}}$ was above the safe limits in $\mathrm{T}_{1}$ (Control) and $\mathrm{T}_{2}$ (Sulphur on the basis of $50 \% \mathrm{GR}$ ) while SAR was above the safe limits in all the treatments. Hydraulic conductivity of soil increased in $\mathrm{T}_{4}$ (Press mud @ $20 \mathrm{tha}{ }^{-1}$ ) as compared to control. However, bulk density decreased in $\mathrm{T}_{4}$ (Press mud @ $20 \mathrm{tha}^{-1}$ ) when compared with control.

In the same lay out wheat variety Faisalabad 2008 was sown and fertilizer was applied @ $120-110-70 \mathrm{NPK} \mathrm{kg} \mathrm{ha}{ }^{-1}$. All the phosphorus and potassium was applied at sowing, while N was applied in three splits. All recommended agronomic and plant protection practices were applied uniformly. Yield data of wheat was recorded at maturity.

Table 7: Effect of sulphur and press mud on grain yield of wheat 2019-20

| Treatments | Grain Yield <br> $\left(\mathrm{t} . \mathrm{ha}^{-1}\right)$ |
| :--- | :--- |
| $\mathrm{T}_{1}$ Control | 1.87 C |
| $\mathrm{T}_{2}$ Sulphur on the basis of $50 \% \mathrm{GR}$ | 2.20 BC |
| $\mathrm{T}_{3}$ Sulphur on the basis of $100 \% \mathrm{GR}$ | 2.78 A |
| $\mathrm{~T}_{4}$ Press mud @ $20 \mathrm{t} \mathrm{ha}^{-1}$ | 2.67 A |
| $\mathrm{~T}_{5}$ Sulphur on the basis of $50 \% \mathrm{GR}+$ Press mud @ $10 \mathrm{t} \mathrm{ha}^{-1}$ | 2.49 AB |
| $\mathrm{T}_{6}$ Sulphur on the basis of $25 \% \mathrm{GR}+$ Press mud @ $15 \mathrm{t} \mathrm{ha}^{-1}$ | 2.59 AB |
| LSD | 0.4021 |

Results revealed that in $\mathrm{T}_{4}$ (Press mud @ $20 \mathrm{t} \mathrm{ha}{ }^{-1}$ ), $\mathrm{T}_{6}$ (Sulphur on the basis of $25 \%$ GR + Press mud @ $15 \mathrm{t} \mathrm{ha}^{-1}$ ), $\mathrm{T}_{5}$ (Sulphur on the basis of $50 \% \mathrm{GR}+$ Press mud @ $10 \mathrm{tha}^{-1}$ ) and $\mathrm{T}_{3}$ (Sulphur on the basis of $100 \% \mathrm{GR}$ ) remained non-significant with each other followed by $\mathrm{T}_{2}$ (Sulphur on the basis of $50 \% \mathrm{GR}$ ). However lowest grain yield was obtained from $\mathrm{T}_{1}$ (Control).

Table 8: Soil analysis after wheat harvest 2019-20

| Treatments | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | $\mathbf{H C}$ <br> $\left(\mathrm{cm} \mathrm{hr}^{-1}\right)$ | BD <br> $\left(\mathrm{Mg} \mathrm{m}^{-3}\right)$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ Control | 8.88 | 4.29 | 33.10 | 0.40 | 1.67 |
| $\mathrm{~T}_{2}$ Sulphur on the basis of 50\%GR | 8.38 | 4.07 | 24.40 | 0.46 | 1.63 |
| $\mathrm{~T}_{3}$ Sulphur on the basis of $100 \% \mathrm{GR}$ | 7.98 | 3.86 | 22.50 | 0.51 | 1.60 |
| $\mathrm{~T}_{4}$ Press mud @ 20 t ha ${ }^{-1}$ | 8.60 | 3.90 | 21.70 | 0.49 | 1.59 |
| $\mathrm{T}_{5}$ Sulphur on the basis of 50\% GR + <br> Press mud @ $10 \mathrm{t} \mathrm{ha}^{-1}$ | 8.59 | 3.96 | 23.90 | 0.48 | 1.62 |
| $\mathrm{T}_{6}$ Sulphur on the basis of $25 \% \mathrm{GR}+$ <br> Press mud @ $15 \mathrm{t} \mathrm{ha}^{-1}$ | 8.56 | 3.98 | 22.20 | 0.48 | 1.61 |

Soil analysis after wheat harvest (Table 8) showed that $\mathrm{pH}_{\mathrm{s}}$ was above the safe limits in all the treatments except in $T_{3}$ (Sulphur on the basis of $100 \% \mathrm{GR}$ ) and $T_{2}$ (Sulphur on the basis of $50 \% \mathrm{GR}$ ) and $\mathrm{EC}_{\mathrm{e}}$ was above the safe limits in $\mathrm{T}_{2}$ (Sulphur on the basis of $50 \% \mathrm{GR}$ ) and $\mathrm{T}_{1}$ (control) while SAR was above the safe limit in all the treatments. Hydraulic conductivity of soil increased in $\mathrm{T}_{4}$ (Press mud @ $20 \mathrm{t} \mathrm{ha}{ }^{-1}$ ) and $\mathrm{T}_{3}$ (Sulphur on the basis of $100 \% \mathrm{GR}$ ) as compared to control. However, bulk density decreased in $T_{4}$ (Press mud @ $20 \mathrm{t} \mathrm{ha}^{-1}$ ) when compared with control.

## 3. LONG TERM EFFECT OF DIFFERENT ORGANIC MANURES AND GYPSUM ON PHYSICAL PROPERTIES OF SALINE SODIC SOIL IN WHEAT-RICE ROTATION

The experiment was designed in 2016 to study the effectiveness of different amendments on downward movement of salts and rehabilitation of soil health with passage of time. A salt affected field $\left\{\mathrm{pH}_{\mathrm{s}}=9.91, \mathrm{EC}_{\mathrm{e}}=10.95 \mathrm{dS} \mathrm{m}-\mathrm{SAR}=89.14\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}, \mathrm{HC}=0.26 \mathrm{~cm} \mathrm{hr}^{-1}\right.$ and $\mathrm{BD}=1.75 \mathrm{Mg} \mathrm{m}^{-3}$, and $\mathrm{GR}=4.40(\mathrm{t}$. acre $\left.)\right\}$ was selected, prepared and leveled. Composite soil samples were collected and analyzed for salinity/sodicity. Experiment was laid out in RCBD with three replications. Gypsum was applied @ $100 \%$ gypsum requirement while poultry manure, FYM, rice straw and press mud were applied @ $20 \mathrm{t} \mathrm{ha}{ }^{-1}$. Gypsum was applied 30 days and organic amendments were applied 15 days before sowing followed by leaching. All the treatments were applied at the start of study. Field was prepared and recommended dose of fertilizers @ 185-90-60 NPK kg ha ${ }^{-1}$ was applied. Rice variety PS-2 was transplanted on 24-0719. All the phosphorus and potassium were applied at transplanting, while nitrogen (N) was applied in three splits. All agronomic and plant protection practices were kept constant. The crop was harvested at maturity and paddy yield data was recorded. Soil samples were collected after harvesting of crop. The treatments tested along with paddy yield are as under.
Table 9: Effect of organic manures and gypsum on paddy yield of rice 2019

| Treatments | Paddy yield (t. $\mathrm{ha}^{-1}$ ) |
| :---: | :---: |
| T ${ }_{1}$ Control | 1.11 D |
| $\mathrm{T}_{2}$ Gypsum on the basis of $100 \%$ GR | 2.24 A |
| $\mathrm{T}_{3}$ Poultry manure @ $20 \mathrm{t} . \mathrm{ha}^{-1}$ | 2.11 A |
| T4 FYM @ $20 \mathrm{t} . \mathrm{ha}^{-1}$ | 1.81 B |
| T5 Rice straw @ 20 t . $\mathrm{ha}^{-1}$ | 1.41 C |
| $\mathrm{T}_{6}$ Press mud @ $20 \mathrm{t} . \mathrm{ha}^{-1}$ | 1.74 B |
| LSD | 0.2669 |

The data revealed that paddy yield was maximum in $\mathrm{T}_{2}$ (Gypsum on the basis of $100 \% \mathrm{GR}$ ) and statistically was at par with $\mathrm{T}_{3}$ (Poultry manure @ $20 \mathrm{t} . \mathrm{ha}^{-1}$ ) as compared to other treatments. While minimum was recorded in $\mathrm{T}_{1}$ (Control) followed by $\mathrm{T}_{5}$ (Rice straw @ $20 \mathrm{t} . \mathrm{ha}^{-1}$ ).
Table 10: Soil analysis after rice harvest 2019

| Treatments | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | $\mathbf{H C}$ <br> $\left(\mathrm{cm} \mathrm{hr}^{-1}\right)$ | BD <br> $\left(\mathrm{Mg} \mathrm{m}^{-3}\right)$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ Control | 9.27 | 6.70 | 50.30 | 0.33 | 1.60 |
| $\mathrm{~T}_{2}$ Gypsum on the basis of $100 \% \mathrm{GR}$ | 8.73 | 5.58 | 36.40 | 0.42 | 1.38 |
| $\mathrm{~T}_{3}$ Poultry manure @ 20 t. ha ${ }^{-1}$ | 8.95 | 6.36 | 40.30 | 0.39 | 1.37 |
| $\mathrm{~T}_{4}$ FYM @ 20 t. ha ${ }^{-1}$ | 8.80 | 6.34 | 38.20 | 0.40 | 1.37 |
| $\mathrm{~T}_{5}$ Rice straw @ 20 t. ha ${ }^{-1}$ | 8.85 | 6.39 | 43.90 | 0.37 | 1.42 |
| $\mathrm{~T}_{6}$ Press mud @ 20 t. ha ${ }^{-1}$ | 8.90 | 6.66 | 40.10 | 0.39 | 1.40 |

Post-harvest soil analysis (Table 10) showed $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR were above the safe limits in all the treatments. Hydraulic conductivity of soil increased in $T_{2}$ (Gypsum on the basis of $100 \%$ GR) as compared to control. However, bulk density decreased in $\mathrm{T}_{2}$ (Gypsum on the basis of $100 \% \mathrm{GR}$ ) when compared with control.

In the same lay out wheat variety Faisalabad 2008 was sown and fertilizer was applied @ $120-110-70 \mathrm{NPK} \mathrm{kg} \mathrm{ha}{ }^{-1}$. All the phosphorus and potassium was applied at sowing while N was applied in three splits. All recommended agronomic and plant protection practices were applied uniformly. Yield data of wheat was recorded at maturity and crop was harvested.

Table 11: Effect of organic manures and gypsum on grain yield of wheat 2019-20

| Treatments | Grain Yield <br> (t. $\left.\mathrm{ha}^{-1}\right)$ |
| :--- | :---: |
| $\mathrm{T}_{1}$ Control | 1.17 D |
| $\mathrm{T}_{2}$ Gypsum on the basis of $100 \% \mathrm{GR}$ | 2.90 A |
| $\mathrm{~T}_{3}$ Poultry manure @ $20 \mathrm{t} . \mathrm{ha}^{-1}$ | 2.62 B |
| $\mathrm{~T}_{4} \mathrm{FYM}$ @ 20 t. $\mathrm{ha}^{-1}$ | 2.80 A |
| $\mathrm{~T}_{5}$ Rice straw @ 20 t. ha ${ }^{-1}$ | 1.49 C |
| $\mathrm{T}_{6}$ Press mud @ 20 t. $\mathrm{ha}^{-1}$ | 2.52 B |
| LSD | 0.1253 |

The data revealed (Table 11) that wheat yield was maximum in $\mathrm{T}_{2}$ (Gypsum on the basis of $100 \% \mathrm{GR}$ ) and statistically was at par with $\mathrm{T}_{4}$ (FYM @ $20 \mathrm{t} . \mathrm{ha}^{-1}$ ) as compared to other treatments. While minimum yield was recorded in $\mathrm{T}_{1}$ (Control) followed by $\mathrm{T}_{5}$ (Rice straw @ 20 t. $h a^{-1}$ ).

Table 12: Soil analysis after wheat harvest 2019-20

| Treatments | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | $\mathbf{H C}$ <br> $\left(\mathrm{cm} \mathrm{hr}^{-1}\right)$ | $\mathbf{B D}$ <br> $\left(\mathrm{Mg} \mathrm{m}^{-3}\right)$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ Control | 9.26 | 6.59 | 49.30 | 0.33 | 1.60 |
| $\mathrm{~T}_{2}$ Gypsum on the basis of 100\%GR | 8.70 | 5.55 | 35.40 | 0.43 | 1.37 |
| $\mathrm{~T}_{3}$ Poultry manure @ 20 t. ha ${ }^{-1}$ | 8.93 | 6.34 | 39.30 | 0.39 | 1.36 |
| $\mathrm{~T}_{4}$ FYM @ 20 t. ha ${ }^{-1}$ | 8.78 | 6.32 | 37.20 | 0.40 | 1.37 |
| $\mathrm{~T}_{5}$ Rice straw @ 20 t. ha ${ }^{-1}$ | 8.83 | 6.37 | 42.90 | 0.37 | 1.41 |
| $\mathrm{~T}_{6}$ Press mud @ 20 t. ha ${ }^{-1}$ | 8.88 | 6.64 | 39.10 | 0.39 | 1.39 |

Post-harvest soil analysis (Table 12) showed that $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR were above the safe limits in all the treatments. Hydraulic conductivity of soil increased in $T_{2}$ (Gypsum on the basis of $100 \%$ GR) as compared to control. However, bulk density decreased in $\mathrm{T}_{2}$ (Gypsum on the basis of $100 \% \mathrm{GR}$ ) when compared with control.

## 4. SCREENING OF GUAVA VARIETIES AGAINST SALINITY / SODICITY LEVELS

The experiment was designed in 2019 for screening of guava varieties against different combinations of salinity / sodicity levels. A normal soil was selected and desired salinity/sodicity levels were developed using salts $\mathrm{NaCl}, \mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}$. After establishing, desired levels of $\mathrm{EC}_{\mathrm{e}}$ and SAR, the soil was filled in the pots as per treatment plan. Five guava(surahi medium, surkha gola, surahi large, sufaid gola and sundora gola) varieties were tested and design of experiment was CRD factorial with three replications. The guava plants were transplanted in pots according to treatment plan and base line data is given below (Table 13).

Table:13 Base line data of guava plants against salinity / sodicity

| Treatments / Variety | Plant height (cm) |  |  | Stem diameter (inch) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Surahi medium $\mathrm{EC}_{\mathrm{e}}<4, \mathrm{SAR}<15$ | 87 | 83.5 | 84.5 | 0.23 | 0.27 | 0.35 |
| $\begin{aligned} & \hline \text { Surkha gola } \\ & {E C_{e}<4, \text { SAR }<15}^{2} \end{aligned}$ | 88 | 84 | 82 | 0.33 | 0.26 | 0.29 |
| $\begin{aligned} & \hline \text { Surahi large } \\ & \mathrm{EC}_{\mathrm{e}}<4, \text { SAR }<15 \\ & \hline \end{aligned}$ | 84 | 75.5 | 68 | 0.30 | 0.37 | 0.31 |

## 5. SCREENING OF GRAPES VARIETIES AGAINST DIFFERENT SALINITY / SODICITY LEVELS

The experiment was designed in 2019 for screening of grapes varieties against different combinations of salinity / sodicity levels. A normal soil was selected and desired salinity/sodicity levels were developed using salts $\mathrm{NaCl}, \mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}$. After establishing, desired levels of $\mathrm{EC}_{\mathrm{e}}$ and SAR , the soil was filled in the pots as per treatment plan. Six grapes (king ruby, Priest, Perlet, Sundar khani, Muscat hambourg and NARC black) varieties were tested and design of experiment was CRD factorial with three replications. The grapes plants were transplanted in salinity blocks according to treatment plan and base line data is given below (Table 14).
Table:14 Base line data of grapes plant against salinity / sodicity

| Treatments/ | Plant height (cm) |  |  | Stem diameter (inch) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { King ruby } \\ & \mathrm{EC}_{\mathrm{e}}<4, \text { SAR }<15 \end{aligned}$ | 58 | 49 | 39 | 0.29 | 0.22 | 0.29 |

### 5.2 WATER QUALITY DIVISION

## 6. DISSEMINATION OF TECHNOLOGIES FOR SAFE UTILIZATION OF BRACKISH WATER AT PINDI BHATTIAN

An experiment was conducted to assess the level of brackishness of water samples collected from the farmer's tube wells at Pindi Bhattian and disseminate technologies for its safe use. Tube well water samples from twenty farmers at Pindi Bhattian were collected and analyzed for determining quality of water with respect to $\mathrm{EC}_{\mathrm{iw}}, \mathrm{SAR}$ and RSC.

During first quarter from July to September 2019, twenty farmers were contacted and collected 21 water samples. The detail of the water samples analysis is also given in the form of a table below:-

TABLE: 15 Table showing farmer's water sample analysis high in parameters

| Unfit Due to |  |  | M. Fit Due to |  |  | Fit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| EC | RSC | EC+RSC | EC | RSC | EC+RSC |  |
| - | 03 | 05 | 01 | 08 | - | 04 |
| Total Unfit |  | 08 | Total M. Fit |  | 09 | 04 |

Out of 21 tube-well water samples, eight were found unfit. It was observed that tube well water samples were unfit with respect to parameters, $\mathrm{EC}=0, \mathrm{RSC}=03$, and $\mathrm{EC}+\mathrm{RSC}=05$. Out of 21 tube-well water samples, nine were found marginally fit. It was observed that tube well water samples were marginally fit with respect to parameters, $\mathrm{EC}=01, \mathrm{RSC}=08$, and $\mathrm{EC}+\mathrm{RSC}=0$. The remaining four tube-well water samples were fit during random farmer's tube-well water sampling (Table 15).

During second quarter from October to December 2019, twenty soil samples were collected from the same 20 farmers contacted previously.

TABLE: 16 Table showing farmers 21 soils sample analysis high in parameters

| $\mathrm{pH}_{\mathrm{s}}$ | SAR | $\mathrm{EC}_{\mathrm{e}}+\mathrm{SAR}$ | $\mathrm{pH}_{\mathrm{s}}+\mathrm{EC}_{\mathrm{e}}+\mathrm{SAR}$ | Normal |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 02 | 01 | 01 | 15 |

Out of 20 soil samples, fifteen farmers soil samples were found normal while others detail is given in table above (Table 16).

During $3{ }^{\text {rd }}$ quarter from January to March 2020, twenty one farmers were contacted and collected 21 tubewell water samples. The detail of the water samples analysis is given in the form of a table below:-

TABLE 17: Table showing farmer's water sample analysis high in parameters

| Unfit Due to |  |  | Marginally Fit Due to |  |  | Fit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TDS | RSC | TDS+RSC | TDS | RSC | EC+RSC |  |
| 03 | 07 | 00 | 00 | 01 | - | 10 |
| Total Unfit |  |  | 10 | Total Marginally Fit |  |  |

Out of 21 tube-well water samples, ten were found unfit. It was observed that tube well water samples were unfit with respect to parameters, $\mathrm{TDS}=03, \mathrm{RSC}=07$, and $\mathrm{TDS}+\mathrm{RSC}=0$. Out of 21 tube-well water samples, one was found marginally fit. It was observed that one tube well water sample was marginally fit with respect to parameter, $\mathrm{RSC}=01$. The remaining ten tube-well water samples were fit during random farmer's tube-well water sampling (Table 17).

During $4^{\text {th }}$ quarter from April to June 2020, twenty one soil samples were collected from the same 21 farmers contacted previously.

TABLE 18: Table showing farmers 21 soils sample analysis high in parameters

| $\mathrm{pH}_{\mathrm{s}}$ | $\mathrm{pH}_{\mathrm{s}}+\mathrm{SAR}$ | $\mathrm{EC}_{\mathrm{e}}$ | $\mathrm{EC}_{\mathrm{e}}+\mathrm{SAR}$ | $\mathrm{pH}_{\mathrm{s}}+\mathrm{EC}_{\mathrm{e}}+\mathrm{SAR}$ | Normal |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 03 | 02 | 01 | 01 | 00 | 14 |

Out of 21 soil samples, fourteen farmers soil samples were found normal while others detail is given in table 18).

## 7. LONG TERM EFFECT OF HGH RSC TUBE WELL WATER IRRIGATION ON PHYSICO-CHEMICAL PROPERTIES OF SOIL UNDER RICE-WHEAT ROTATION

A field study was conducted to monitor the long term effect of brackish tube well-water on physicochemical properties of soil and its sustainable management for successful crop production under ricewheat rotation in a normal soil at Rakh Research Farm, Soil Salinity Research Institute, Pindi Bhattian. The treatments studied are given in table below. Field analysis showed, $\mathrm{pH}_{\mathrm{s}}=7.97, \mathrm{EC}_{\mathrm{e}}=3.32\left(\mathrm{dS} \mathrm{m} \mathrm{m}^{-1}\right)$, SAR $=13.25\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$, Available $\mathrm{P}=6.80 \mathrm{mg} \mathrm{kg}^{-1}$, Extractable $\mathrm{K}=102.0 \mathrm{mg} \mathrm{kg}^{-1}, \mathrm{O} . \mathrm{M}=0.40 \%, \mathrm{HC}$ $=0.89 \mathrm{~cm} \mathrm{hr}^{-1}, \mathrm{BD}=1.28 \mathrm{~g} \mathrm{~m}^{-3}$, Texture = Sandy Loam. Brackish tube-well irrigation water $\left(\mathrm{EC}_{\mathrm{iw}} 1.33\right.$ $\mathrm{dS} \mathrm{m}{ }^{-1}$, SAR $8.83\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ and RSC $7.90 \mathrm{me} \mathrm{L}^{-1}$ ) was used for irrigation. Recommended dose of fertilizer @ $150-85-60 \mathrm{NPK} \mathrm{kg} \mathrm{ha}{ }^{-1}$ to rice Basmati variety PS-2 was applied. Cultural practices were carried out as and when required. Crop was harvested at maturity. Rice transplantation and harvesting date was 21-06-2019 and 29-10-2019 respectively. Data regarding plant height, number of tillers per hill, paddy and straw yield was recorded and presented in table below. Post harvest soil analysis data is also given in the table below.

Table 19 : Effect of Brackish irrigation water treatments on Paddy and Straw yield of Rice (2019)

| Treatments | Plant Height (cm) | No. of tillers / hill | $\begin{aligned} & \hline \text { Paddy } \\ & \left(\text { t. } \text { ha }^{-1}\right) \end{aligned}$ | $\begin{gathered} \text { Straw } \\ \left(\text { t. } \mathbf{h a}^{-1}\right) \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ : Canal water (Control) | 137.67 A | 38.00 AB | 3.92 A | 8.18 A |
| $\mathrm{T}_{2}$ : Brackish tube-well water | 122.00 B | 32.33 C | 3.43 C | 7.12 B |
| $\mathrm{T}_{3}$ : Alternate irrigations with Canal \& brackish tube well water | 131.00 B | 35.00 BC | 3.61 B | 7.89 A |
| $\mathrm{T}_{4}$ : Cyclic use of Canal and brackish tube Well Water (Growing of kharif crop with brackish water and rabi crop with canal water) | 123.67 C | 32.66 C | $\begin{gathered} 3.46 \\ \mathrm{BC} \\ \hline \end{gathered}$ | 6.93 B |
| $\mathrm{T}_{5}$ : Gypsum on the basis of RSC of tube well water | 136.00 AB | 38.66 A | 3.81 A | 8.07 A |
| T6: Gypsum on the basis of RSC of tube well water $+20 \%$ Leaching Fraction | 137.67 A | 38.33 A | 3.84 A | 8.10 A |
| LSD | 5.1026 | 3.0802 | 0.1631 | 0.3897 |

Results (Table-19) showed that maximum plant height 137.67 cm was recorded in $\mathrm{T}_{1}$ treatment which was non-significant with $T_{6}(137.67 \mathrm{~cm})$ followed by $T_{5}, T_{3}, T_{2}$ and $T_{4}$. In case of number of tillers / hill, maximum tillers (38.66) were found in $\mathrm{T}_{5}$ treatment but the increase was non-significant with respect to $T_{6}$ (38.33) followed by $T_{1}$. Highest paddy yield of 3.92 t / ha was obtained from $\mathrm{T}_{1}$ treatment which was significantly higher than all other treatments except $\mathrm{T}_{6}$ and $\mathrm{T}_{5}$. In case of straw yield, highest straw yield of 8.18 t . ha ${ }^{-1}$ was obtained in $\mathrm{T}_{1}$ treatment which was non-significant with $\mathrm{T}_{6}, \mathrm{~T}_{5}$ and $\mathrm{T}_{3}$.

Table 20: Post Harvest Soil Analysis

| Treatments | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathbf{d S ~ m}^{-1}\right)$ | $\mathbf{S A R}$ <br> $\left(\mathbf{m m o l ~ L}^{-1}\right)^{1 / 2}$ |
| :--- | :---: | :---: | :---: |
| $\mathrm{~T}_{1}:$ Canal water (Control) | 7.95 | 3.28 | 12.90 |
| $\mathrm{~T}_{2}:$ Brackish tube-well water | 8.00 | 3.40 | 14.30 |
| $\mathrm{T}_{3}:$ Alternate irrigations with Canal \& brackish tube well <br> water | 7.99 | 3.35 | 14.20 |
| $\mathrm{T}_{4}:$ Cyclic use of Canal and brackish tube Well <br> Water (Growing of kharif crop with brackish <br> water and rabi crop with canal water) | 8.00 | 3.38 | 14.30 |
| $\mathrm{~T}_{5}:$ Gypsum on the basis of RSC of tube well water | 7.94 | 3.30 | 12.80 |
| $\mathrm{T}_{6}:$ Gypsum on the basis of RSC of tube well water $+20 \%$ <br> Leaching Fraction | 7.94 | 3.29 | 12.50 |

Post-harvest analysis (table 20) demonstrated that improvement was observed in $\mathrm{T}_{1}$ and gypsum application reduced the $\mathrm{pH}_{5}, \mathrm{EC}_{\mathrm{e}}$ and $\operatorname{SAR}$ in $\mathrm{T}_{5}$ and $\mathrm{T}_{6}$.

Wheat variety Faisalabad-2008 was sown after rice harvest on the same layout and treatments. Recommended dose of fertilizer @ 120-110-70 NPK $\mathrm{kg} \mathrm{ha}^{-1}$ was applied. Cultural practices were carried out as and when required. Wheat sowing and harvesting date was 12-11-2019 and 22-04-2020 respectively. Data regarding plant height, number of tillers per $\mathrm{m}^{2}$, grain and straw yield was recorded and presented in table below. Post harvest soil analysis data is also given in the table below.

Table 21 Effect of Brackish irrigation water treatments on Grain and Straw yield of wheat (2019-20)

| Treatments | Plant Height <br> $(\mathrm{cm})$ | No. of <br> tillers $/ \mathrm{m}^{2}$ | Grain <br> $\left(\mathrm{t} . \mathrm{ha}^{-1}\right)$ | Straw <br> $\left(\mathrm{t}\right.$. ha $\left.{ }^{-1}\right)$ |
| :--- | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}:$ Canal water (Control) | 128.67 A | 234.67 A | 4.03 A | 4.17 A |
| $\mathrm{~T}_{2}$ : Brackish tube-well water | 120.00 B | 227.00 B | 3.40 C | 3.50 D |
| $\mathrm{T}_{3}:$ Alternate irrigations with Canal \& brackish <br> tube well water | 123.67 AB | 231.67 <br> AB | 3.50 BC | 3.53 D |
| $\mathrm{T}:$ : Cyclic use of Canal and brackish tube well <br> water (Growing of kharif crop with brackish <br> water and rabi crop with canal water) | 125.33 AB | 232.33 A | 3.58 B | 3.73 C |
| $\mathrm{T}_{5}:$ Gypsum on the basis of RSC of tube well <br> water | 139.67 A | 235.00 A | 3.93 A | 3.90 BC |
| $\mathrm{T}_{6}:$ Gypsum on the basis of RSC of tube well <br> water $+20 \%$ Leaching Fraction | 129.67 A | 235.33 A | 3.94 A | 4.00 AB |
| LSD | 6.1784 | 4.8929 | 0.1413 | 0.1965 |

Results (Table-21) showed that maximum plant height 129.67 cm was observed in $\mathrm{T}_{5}$ which was non-significant with $\mathrm{T}_{6}, \mathrm{~T}_{1}$ followed by $\mathrm{T}_{4}$ and $\mathrm{T}_{3}$. Maximum numbers of tillers per square meter (235.33) were recorded from $T_{6}$ which was non-significant with all other treatments except $T_{3}$ and $T_{2}$. Highest grain
yield of 4.03 t . ha ${ }^{-1}$ was obtained from treatments $\mathrm{T}_{1}, \mathrm{~T}_{6}$ and $\mathrm{T}_{5}$ which were non-significant with each other. In case of straw yield maximum straw yield of 4.17 t . ha ${ }^{-1}$ was obtained from $\mathrm{T}_{1}$ which was significantly higher than all other treatments. Minimum straw yield of $3.50 \mathrm{t} . \mathrm{ha}^{-1}$ was obtained from $\mathrm{T}_{2}$ where brackish tube-well water was applied.
Table 22:- Soil Analysis after wheat 2019-20

| Treatments | pH ${ }_{\text {s }}$ | $\begin{gathered} \mathbf{E C}_{\mathbf{e}} \\ \left(\mathbf{d S} \mathbf{m}^{-1}\right) \end{gathered}$ | $\underset{\left.\mathrm{nmol} \mathrm{~L}^{-1}\right)^{1 / 2}}{\text { SAR }}$ |
| :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ : Canal water (Control) | 7.95 | 3.28 | 12.90 |
| $\mathrm{T}_{2}$ : Brackish tube-well water | 8.01 | 3.41 | 15.00 |
| $\mathrm{T}_{3}$ : Alternate irrigations with Canal \& brackish tube well water | 8.00 | 3.36 | 14.80 |
| $\mathrm{T}_{4}$ : Cyclic use of Canal and brackish tube well Water (Growing of kharif crop with brackish water and rabi crop with canal water) | 8.00 | 3.38 | 14.20 |
| $\mathrm{T}_{5}$ : Gypsum on the basis of RSC of tube well water | 7.94 | 3.30 | 12.78 |
| $\mathrm{T}_{6}$ : Gypsum on the basis of RSC of tube well water + $20 \%$ Leaching Fraction | 7.93 | 3.28 | 12.50 |

Post-harvest analysis (table 22) demonstrated that improvement was remained almost same as observed after rice 2019 harvest. However SAR was improved somewhat in treatments where gypsum was applied.

## 8. TEMPORAL CHANGES IN SOIL pH AFTER SULFURIC ACID APPLICATION IN HIGHLY SALINE SODIC SOIL

A field study was conducted to observe the changes in soil pH with the passage of time after sulfuric acid application in highly salt affected soil at Rakh Research Farm, Soil Salinity Research Institute, Pindi Bhattian. The treatments studied are given in table below. The selected field analysis showed $\mathrm{pH}_{\mathrm{s}} 10.94$, $\mathrm{EC}_{\mathrm{e}} 11.39 \mathrm{dS} \mathrm{m}^{-1}$, SAR $100.38\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$, available $\mathrm{P}=5.20 \mathrm{mg} \mathrm{kg}^{-1}$, Extractable $\mathrm{K}=89.00 \mathrm{mg} \mathrm{kg}^{-1}$, O. $\mathrm{M}=0.21 \%, \mathrm{GR}=5.80 \mathrm{t} \mathrm{acre}{ }^{-1}, \mathrm{HC}=0.27 \mathrm{~cm} \mathrm{hr}^{-1}, \mathrm{BD}=1.65 \mathrm{~g} \mathrm{~m}^{-3}$, Texture $=$ Loam and $\mathrm{CaCO}_{3}=$ $10.80 \%$. Brackish tube-well irrigation water ( $\mathrm{EC}_{\mathrm{iw}} 1.05 \mathrm{dS} \mathrm{m}^{-1}$, SAR $7.03\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ and RSC 5.10 me $\mathrm{L}^{-1}$ ) was used for irrigation. Recommended dose of fertilizer @ $150-85-60 \mathrm{NPK} \mathrm{kg} \mathrm{ha}{ }^{-1}$ to Basmati rice variety PS-2 was applied. Cultural practices were carried out as and when required. Crop was harvested at maturity. Rice transplantation and harvesting date was 22-07-2019 and 28-10-2019 respectively. Data regarding plant height, number of tillers per hill, paddy and straw yield was recorded and is presented in table. Post harvest soil analysis data is also given in the table below.

Table 23: Effect of Brackish irrigation water treatments on Paddy and Straw Yield of Rice (2019)

| Treatments | Plant Height (cm) | No. of tillers/hill | Paddy (t. ha ${ }^{-1}$ ) | $\begin{aligned} & \text { Straw } \\ & (\text { t. ha } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ : Control | 0.00 B | 0.00 D | 0.00 D | 0.00 D |
| $\mathrm{T}_{2}$ : Sulfuric acid application equivalent to $100 \%$ GR of soil | 117.33 A | 31.33 A | 1.83 A | 3.90 A |
| $\mathrm{T}_{3}$ : Sulfuric acid application equivalent to $75 \% \mathrm{GR}$ of soil | 116.00 A | 30.00 A | 1.50 B | 3.46 B |
| $\mathrm{T}_{4}$ : Sulfuric acid application equivalent to $50 \% \mathrm{GR}$ of soil | 116.00 A | 21.33 B | 0.53 C | 1.23 C |
| $\mathrm{T}_{5}$ : Sulfuric acid application equivalent to $25 \% \mathrm{GR}$ of soil | 115.00 A | 14.00 C | 0.39 C | 0.89 C |
| LSD | 3.9119 | 4.7633 | 0.2395 | 0.3768 |

Results (Table-23) showed that maximum plant height 117.33 cm was recorded in $\mathrm{T}_{2}$ treatment which was at par with all other treatments except control. In case of number of tillers / hill maximum tillers (31.33) were found in $\mathrm{T}_{2}$ treatment which was non-significant with $\mathrm{T}_{3}$. Highest paddy yield of 1.83 t . ha ${ }^{-1}$ was obtained from $\mathrm{T}_{2}$ treatment which was significantly higher than all other treatments while lowest paddy yield of 0.00 t . ha ${ }^{-1}$ was recorded in $\mathrm{T}_{1}$ (control). In case of straw yield, highest straw yield of 3.90 t . ha ${ }^{-1}$ was obtained in $\mathrm{T}_{2}$ treatment which was significantly higher from all other treatments.

Table 24: Post Harvest Soil Analysis

| Treatments | $\mathrm{pH}_{\mathrm{s}}$ | $\mathrm{EC}_{\mathrm{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{~T}_{1}:$ Control | 10.20 | 12.00 | 97.00 |
| $\mathrm{T}_{2}:$ Sulfuric acid application equivalent to $100 \%$ GR of <br> soil | 8.48 | 5.20 | 30.56 |
| $\mathrm{T}_{3}:$ Sulfuric acid application equivalent to $75 \%$ GR of <br> soil | 8.70 | 6.10 | 45.50 |
| $\mathrm{~T}_{4}:$ Sulfuric acid application equivalent to $50 \%$ GR of soil | 8.90 | 8.00 | 60.00 |
| $\mathrm{~T}_{5}:$ Sulfuric acid application equivalent to $25 \%$ GR of soil | 9.40 | 8.65 | 72.00 |

Post-harvest analysis (table 24) demonstrated that application of $\mathrm{H}_{2} \mathrm{SO}_{4}$ reduced the $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR in all the treatments, however it remained un-affected in all parameters in control plot where $\mathrm{H}_{2} \mathrm{SO}_{4}$ was not used.

Table 25: Temporal changes in Soil pH after Sulfuric Acid Application (Depth 0-15 cm)

| Treatments | After 24 <br> Hours | After Two <br> Days | After Two <br> Weeks | After One <br> Month | After Two <br> Months | Quarterly | Quarterly |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ | 10.30 A | 10.27 A | 10.28 A | 10.25 A | 10.26 A | 10.25 A | 10.24 A |
| $\mathrm{~T}_{2} 100 \%$ | 5.54 E | 6.40 C | 7.40 D | 8.36 C | 8.48 D | 8.52 D | 8.48 D |
| $\mathrm{T}_{3} 75 \%$ | 7.03 D | 7.54 BC | 8.06 C | 8.60 BC | 8.77 C | 8.78 CD | 8.72 C |
| $\mathrm{T}_{4} 50 \%$ | 7.80 C | 7.35 BC | 8.50 BC | 8.53 C | 8.90 C | 8.91 C | 8.78 C |
| $\mathrm{T}_{5} 25 \%$ | 8.36 B | 8.20 b | 8.58 B | 9.10 B | 9.26 B | 9.26 B | 8.95 B |
| LSD | 0.5606 | 1.6281 | 0.4602 | 0.5367 | 0.194 | 0.3225 | 0.131 |

Post-harvest analysis (table 25) showed that application of $\mathrm{H}_{2} \mathrm{SO}_{4}$ reduced $\mathrm{pH}_{5}$ with the passage of time in all the treatments except control where $\mathrm{H}_{2} \mathrm{SO}_{4}$ was not used.

Wheat variety Faisalabad-2008 was sown after rice harvest on same layout and treatments. Recommended dose of fertilizer @ 120-110-70 NPK $\mathrm{kg} \mathrm{ha}^{-1}$ was applied. Cultural practices were carried out as and when required. Wheat sowing and harvesting date was 11-11-2019 and 22-04-2020 respectively. Data regarding plant height, number of tillers per $\mathrm{m}^{2}$, grain and straw yield was recorded and presented in table below. Post harvest soil analysis data is also given in table below.

Table 26: Effect of Brackish irrigation water treatments on Grain and Straw yield of wheat (2019-20)

| Treatments | Plant Height (cm) | $\begin{gathered} \text { No. of } \\ \text { itlorc/m } \end{gathered}$ | $\begin{aligned} & \text { Grain } \\ & \left(\text { t. } \text { ha }^{-1}\right) \end{aligned}$ | $\begin{aligned} & \text { Straw } \\ & (\text { t. ha } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ : Control | 0.00 D | 0.00 E | 0.00 E | 0.00 E |
| $\mathrm{T}_{2}$ : Sulfuric acid application equivalent to $100 \%$ GR of soil | 125.00 A | 229.33 A | 1.60 A | 1.65 A |
| $\mathrm{T}_{3}$ : Sulfuric acid application equivalent to $75 \%$ GR of soil | 117.67 B | 200.00 B | 1.31 B | 1.35 B |
| $\mathrm{T}_{4}$ : Sulfuric acid application equivalent to $50 \%$ GR of soil | 113.33 B B | 173.33 C | 0.67 C | 0.75 C |
| $\mathrm{T}_{5}$ : Sulfuric acid application equivalent to $25 \%$ GR of soil | 104.33 C | 141.67 D | 0.51 D | 0.55 D |
| LSD | 5.0288 | 13.470 | 0.0786 | 0.1010 |

Results (Table-26) showed that maximum plant height 125.00 cm was observed in $\mathrm{T}_{2}$ treatment and was higher than all other treatments. In case of number of tillers per square meter, maximum number of tillers per square meter (229.33) was recorded from $\mathrm{T}_{2}$ which were significantly higher than all other treatments.

Highest grain yield of $1.60 \mathrm{t}_{\mathrm{t}} \mathrm{ha}^{-1}$ was obtained from $\mathrm{T}_{2}$ treatment which was significantly higher than all other treatments, whereas minimum grain yield of $0.00 \mathrm{t} . \mathrm{ha}^{-1}$ was obtained from $\mathrm{T}_{1}$ (control). In case of straw yield maximum straw yield of 1.65 t . ha ${ }^{-1}$ was obtained from $\mathrm{T}_{2}$ which was significant over all other treatments whereas minimum straw yield of $0.00 \mathrm{t}^{\text {. ha }}{ }^{-1}$ was obtained from $\mathrm{T}_{1}$ (control).

Table 27: Soil Analysis of Chemical Properties after wheat 2019-20

| Treatments | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathbf{d S ~ m}^{\mathbf{- 1}}\right)$ | SAR <br> $\left(\mathbf{m m o l ~ L}^{\mathbf{- 1}}\right)^{\mathbf{1 / 2}}$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{T}_{1}:$ Control | 10.10 | 10.00 | 95.00 |
| $\mathrm{~T}_{2}:$ Sulfuric acid application equivalent to 100 \% GR of soil | 8.40 | 4.20 | 26.00 |
| $\mathrm{~T}_{3}:$ Sulfuric acid application equivalent to 75 \% GR of soil | 8.50 | 5.10 | 32.80 |
| $\mathrm{~T}_{4}:$ Sulfuric acid application equivalent to 50 \% GR of soil | 8.80 | 6.00 | 50.00 |
| $\mathrm{~T}_{5}$ : Sulfuric acid application equivalent to $25 \%$ GR of soil | 9.00 | 7.65 | 62.00 |

Post-harvest analysis (table 09) showed that application of $\mathrm{H}_{2} \mathrm{SO}_{4}$ reduced the $\mathrm{pH}_{5}, \mathrm{EC}_{\mathrm{e}}$ and SAR in all the treatments while the parameters remained same in control where $\mathrm{H}_{2} \mathrm{SO}_{4}$ was not used.

Table 28: Soil Analysis of Physical Properties after wheat 2019-20

| Treatments | $\mathbf{H C}$ <br> $\mathbf{c m ~ h r}^{-1}$ | $\mathbf{B D}$ <br> $\mathbf{g ~ m}^{-3}$ | $\mathbf{C a C O 3} \%$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{~T}_{1}$ : Control | 0.26 | 1.69 | 10.00 |
| $\mathrm{~T}_{2}$ : Sulfuric acid application equivalent to 100 \% GR of soil | 0.88 | 1.30 | 4.00 |
| $\mathrm{~T}_{3}$ : Sulfuric acid application equivalent to 75 \% GR of soil | 0.57 | 1.35 | 4.50 |
| $\mathrm{~T}_{4}$ : Sulfuric acid application equivalent to 50 \% GR of soil | 0.52 | 1.51 | 5.50 |
| $\mathrm{~T}_{5}$ : Sulfuric acid application equivalent to $25 \%$ GR of soil | 0.33 | 1.61 | 6.68 |

Post-harvest analysis (table 28) showed that application of $\mathrm{H}_{2} \mathrm{SO}_{4}$ improved HC , increased BD and decreased $\mathrm{CaCO}_{3} \%$ in all the treatments except control where $\mathrm{H}_{2} \mathrm{SO}_{4}$ was not used.

Table 29: Changes in Soil pH after Sulfuric Acid Application (Depth 0-15 cm)

| $\mathrm{~T}_{4}$ | 7.80 C | 7.35 BC | 8.50 BC | 8.53 C | 8.90 C | 8.91 C | 8.78 C | 8.76 B | 8.70 B | 8.46 B |
| $\mathrm{~T}_{5}$ | 8.36 B | 8.20 b | 8.58 B | 9.10 B | 9.26 B | 9.26 B | 8.95 B | 8.73 B | 8.76 B | 8.56 B |
| LSD | 0.5606 | 1.6281 | 0.4602 | 0.5367 | 0.1940 | 0.3225 | 0.1310 | 0.3686 | 0.3700 | 0.4266 |

Po-harvest analysis (table 29) showed that application of $\mathrm{H}_{2} \mathrm{SO}_{4}$ reduced $\mathrm{pH}_{5}$ with the passage of time in all the treatments except control where $\mathrm{H}_{2} \mathrm{SO}_{4}$ was not used.

## 9. EFFECT OF EXOGENOUS APPLICATION OF SALICYLIC ACID USING SALINE WATER ON YIELD OF BRINJAL AND TURNIP

A pot study was conducted to investigate the effect of exogenous application of salicylic acid using saline water on yield of Brinjal (Solanummelongena) and Turnip (Brassica rapa subsp. rapa) at campus, Soil Salinity Research Institute, Pindi Bhattian. The treatments studied were A- Salinity Levels (SL):- $\mathrm{T}_{1}{ }^{-}$ Control, $\mathrm{T}_{2^{-}} \mathrm{EC}_{\mathrm{iw}} 3.0 \mathrm{dS} \mathrm{m}^{-1}, \mathrm{~T}_{3}-\mathrm{EC}_{\mathrm{iw}} 5.0 \mathrm{dS} \mathrm{m} \mathrm{m}^{-1}, \mathrm{~T}_{4}-\mathrm{EC}_{\mathrm{iw}} 7.0 \mathrm{dS} \mathrm{m}{ }^{-1}$, B:- Salicylic acid (SA) Levels: 1-No SA spray, 2- $150 \mathrm{ppm} \mathrm{SA}, 3-300 \mathrm{ppm} \mathrm{SA}$ and $4-450 \mathrm{ppm}$ SA. The selected field analysis showed $\mathrm{pH}_{\mathrm{s}}=8.02, \mathrm{EC}_{\mathrm{e}}=1.48\left(\mathrm{dS} \mathrm{m} \mathrm{m}^{-1}\right), \mathrm{SAR}=4.41\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$, Available $\mathrm{P}=5.60 \mathrm{mg} \mathrm{kg}^{-1}$, Extractable $\mathrm{K}=$ $96.0 \mathrm{mg} \mathrm{kg}^{-1}, \mathrm{O} . \mathrm{M}=0.46 \%$ and Texture $=$ Sandy Loam. Brackish tube-well irrigation water $\left(\mathrm{EC}_{\mathrm{iw}} 0.80\right.$ $\mathrm{dS} \mathrm{m}{ }^{-1}$, SAR $3.27\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ and RSC $3.35 \mathrm{me} \mathrm{L}^{-1}$ ) was used for irrigation. Recommended dose of fertilizer @ 75-20-20 NPK $\mathrm{kg} \mathrm{ha}^{-1}$ to Brinjal variety Black Beauty was applied. One third nitrogen was applied as basal dose while remaining two third N was top dressed in two splits 30 and 55 days after sowing. Cultural practices were carried out as and when required. Crop was harvested at maturity. Brinjal transplantation and harvesting date was 22-07-2019 and 28-10-2019 ( 6 to 7 pickings) respectively. Data regarding brinjal yield was recorded. Post harvest soil analysis data is given in the table below. Water salinity was developed by using $\mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{NaCl}, \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}(4: 3: 2: 1)$. Salicylic Acid was sprayed on the next day after saline water application. Salicylic Acid was dissolved in ethanol.

Table 30: Effect of Salicylic Acid and Different Salinity Levels on Brinjal Yield

| Salinity Levels | NO SA |  | 150 ppm |  | 300 ppm |  | 450 ppm |  | Mean |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Canal Water | 348.67 | CDE | 376.67 | CD | 460.00 | A | 460.00 |  | 411.33 A |  |
| $3 \mathrm{dS} / \mathrm{m}$ | 340.00 | CDE | 346.67 | CDE | 430.00 |  | 436.67 |  | 388.33 A | A |
| $5 \mathrm{dS} / \mathrm{m}$ | 330.00 | DE | 343.33 | CDE | 376.67 |  | 383.33 |  | 358.33 | B |
| $7 \mathrm{dS} / \mathrm{m}$ | 328.33 | DE | 308.33 | E | 343.33 | CDE | 320.00 | E | 325.00 |  |
| Mean | 336.75 | B | 343.75 | B | 402.50 | A | 400.00 | A | ----- |  |
| Parameter | LSD |  |  |  |  |  |  |  |  |  |
| SL | 24.644 |  |  |  |  |  |  |  |  |  |
| SA | 24.644 |  |  |  |  |  |  |  |  |  |
| Interaction | 49.289 |  |  |  |  |  |  |  |  |  |

Results (Table-30) showed that maximum brinjal yield of 402 grams was obtained from salicylic acid spray level @ 300 ppm followed by 450 ppm while lowest brinjal yield of 325 grams was recorded at salinity level $7.0 \mathrm{dS} \mathrm{m}^{-1}$. Maximum brinjal yield was obtained at SA levels 300 ppm and 450 ppm and both were non-significant with each other.

Table: 31 Post-Harvest Soil Analyses:

|  | B: Salicylic acid Levels |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | NO SA |  |  | SA @ 150 ppm |  |  | SA @ 300 ppm |  |  | SA @ 450 ppm |  |  |
|  | $\mathrm{pH}_{\text {s }}$ | $\mathrm{EC}_{\mathrm{e}}$ | SAR | $\mathrm{pH}_{\mathrm{s}}$ | $\mathrm{EC}_{\text {e }}$ | SAR | $\mathrm{pH}_{\mathrm{s}}$ | $\mathrm{EC}_{\mathrm{e}}$ | SAR | $\mathrm{pH}_{\mathrm{s}}$ | $\mathrm{EC}_{\mathrm{e}}$ | SAR |
| Control | 8.01 | 1.47 | 4.40 | 8.00 | 1.47 | 4.40 | 8.00 | 1.46 | 4.37 | 8.00 | 1.45 | 4.36 |
| $3 \mathrm{dS} / \mathrm{m}$ | 8.10 | 1.50 | 4.40 | 8.10 | 1.48 | 4.41 | 8.00 | 1.46 | 4.40 | 8.00 | 1.47 | 4.39 |
| $5 \mathrm{dS} / \mathrm{m}$ | 8.10 | 1.51 | 4.42 | 8.10 | 1.48 | 4.41 | 8.10 | 1.46 | 4.40 | 8.10 | 1.47 | 4.40 |
| $7 \mathrm{dS} / \mathrm{m}$ | 8.11 | 1.53 | 4.42 | 8.10 | 1.48 | 4.41 | 8.10 | 1.47 | 4.40 | 8.10 | 1.47 | 4.41 |

Post-harvest analysis (table 31) showed that $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR somewhat increased with increase in salinity levels. Increasing salicylic acid levels showed improvement in chemical-parameters.

Turnip variety white was sown after brinjal harvest on same layout and treatments. Recommended dose of fertilizer @ 125-75-00 NPK kg ha ${ }^{-1}$ was applied. Cultural practices were carried out as and when required. Turnip sowing and harvesting date was 05-11-2019 and 16-03-2020 respectively. Data turnip yield was recorded and presented in table below. Post harvest soil analysis data is also given in table below.

Table 31: Effect of Salicylic Acid and Different Salinity Levels on Turnip Yield

| Salinity Levels | NO SA | $\mathbf{1 5 0} \mathbf{~ p p m}$ | $\mathbf{3 0 0} \mathbf{~ p p m}$ | $\mathbf{4 5 0} \mathbf{~ p p m}$ | Mean |  |

Post-harvest analysis (table 32) showed that $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR somewhat increased with increase in salinity levels. Increasing salicylic acid levels showed improvement in chemical-parameters.

### 5.3 SOIL RECLAMATION DIVISION

## 10. REHABILITATION OF BARREN SALT AFFECTED SOIL USING BRACKISH WATER

The objective of the experiment was to monitor the reclamation process using brackish water in rice-wheat cropping system. A five-acre barren field $\left\{\mathrm{pH}_{\mathrm{s}}=8.95-9.43, \mathrm{EC}_{\mathrm{e}}=7.86-9.02(\mathrm{dS} \mathrm{m}\right.$ ${ }^{1}$ ), SAR $=83.22-95.68\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}, \mathrm{GR}=3.61-4.13\left(\mathrm{t}\right.$. acre $\left.\left.^{-1}\right)\right\}$ was selected at Rakh Farm, Pindi Bhattian. Soil samples were collected from each acre and were analyzed for salinity and sodicity parameters. Field was laser levelled and thoroughly prepared through deep ploughing and planking. Gypsum was applied according to laboratory analysis and followed by leaching. Rice variety "Basmati 515 '" was transplanted on 01-08-2019 and recommended dose of fertilizers ( $150-90-60 \mathrm{NPK} \mathrm{kg} \mathrm{ha}{ }^{-1}$ ) was applied. Tube-well water ( $\mathrm{EC}=1.00 \mathrm{dS} \mathrm{m}^{-1}$, $\mathrm{SAR}=$ $6.97\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ and $\mathrm{RSC}=5.10 \mathrm{me} \mathrm{L}^{-1}$ ), was used for crop production. All agronomic and plant protection measures were applied uniformly. Crop was harvested on 12-11-2019 and paddy yield data was recorded. Soil samples were collected after harvesting of crop.

Table 33: Effect of gypsum application on paddy yield of rice 2019

| Field | Paddy yield <br> $\left(\mathrm{t} . \mathrm{ha}^{-1}\right)$ |
| :---: | :---: |
| Acre No.1 | 2.76 |
| Acre No.2 | 2.65 |
| Acre No.3 | 2.84 |
| Acre No.4 | 2.59 |
| Acre No.5 | 2.91 |

Results (Table 33) indicated that paddy yield recorded from all five acres ranged from 2.59-2.91 t . ha ${ }^{-1}$ having little variation among different fields.

Table 34: Soil analysis after rice harvest 2019

| Field | $\mathbf{p H}_{\mathbf{s}}$ | $\left.\begin{array}{c}\mathbf{E C}_{\mathbf{e}} \\ (\mathrm{dS} \mathrm{m}\end{array}\right)$ |
| :---: | :---: | :---: | :---: | | $\mathbf{S A R}$ |
| :---: |
| $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ |$|$| Acre No.1 | $8.43-8.50$ | $3.65-3.95$ |
| :---: | :---: | :---: |
| Acre No.2 | $8.42-8.48$ | $3.90-4.10$ |
| Acre No.3 | $8.39-8.46$ | $3.59-4.00$ |
| Acre No.4 | $8.49-8.54$ | $3.98-4.12$ |
| Acre No.5 | $8.36-8.45$ | $3.58-3.92$ |

Post-harvest soil analysis (Table 34) showed that there was significant depreciation in, all salinity and sodicity parameters i.e. $\mathrm{EC}_{\mathrm{e}}, \mathrm{pH}_{\mathrm{s}}$ and, SAR.

After harvesting of rice 2019, in the same field with same layout wheat (Faisalabad 2008) was sown. Field was thoroughly prepared by repeated ploughing and planking. Recommended dose
of fertilizer 160-114-60 NPK kg ha ${ }^{-1}$ was applied. The date of wheat sowing was 05-12-2019. All agronomic and plant protection measures were applied uniformly. Crop was harvested on 07-05-2020 and grain yield data was recorded. Soil samples were collected after harvesting of crop and were analyzed in laboratory for salinity and sodicity.

Table 35: Effect of gypsum application on grain yield of wheat 2019

| Field | Grain yield <br> $\left(\right.$ t. ha $\left.{ }^{-1}\right)$ |
| :---: | :---: |
| Acre No.1 | 2.46 |
| Acre No.2 | 2.61 |
| Acre No.3 | 2.76 |
| Acre No.4 | 2.49 |
| Acre No.5 | 2.81 |

Results (Table 35) indicated that wheat grain yield recorded from all five acres ranged from 2.462.81 t . ha ${ }^{-1}$ having little variation among different fields.

Table 36: Soil analysis after wheat harvest 2019-20

| Field | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ |
| :---: | :---: | :---: | :---: |
| Acre No.1 | $8.31-8.35$ | $3.19-3.57$ | $13.28-14.38$ |
| Acre No.2 | $8.23-8.32$ | $3.38-3.71$ | $13.10-13.78$ |
| Acre No.3 | $8.26-8.29$ | $2.97-3.48$ | $12.77-14.18$ |
| Acre No.4 | $8.18-8.25$ | $3.58-3.76$ | $12.98-13.62$ |
| Acre No.5 | $8.20-8.31$ | $2.89-3.32$ | $13.86-14.36$ |

Post-harvest soil analysis (Table 36) showed that there was significant depreciation in, all salinity and sodicity parameters i.e. $\mathrm{EC}_{\mathrm{e}}, \mathrm{pH}_{\mathrm{s}}$ and, SAR and all these parameters were under the safe limit.

## 11. REHABILITATION OF SALINE SODIC SOILS THROUGH CULTIVATION OF SALT TOLERANT GRASSES

A field study was conducted to investigate the performance of various perennial salt tolerant grasses under salt affected conditions and their impact in improving soil health. A salt affected field was selected, prepared and leveled. Composite soil samples were collected and analyzed for salinity/sodicity. Grasses tested were; 1. Mott grass, 2. Para grass, 3. Rhodes grass and 4. Kallar grass. Experiment was laid out in RCBD with three replications. Tufts of grasses were planted in October 2017 according to treatment plan. One bag of DAP and SOP and half bag of Urea/acre was applied at land preparation while one bag of Urea/acre was applied after every harvest (three months). Fresh fodder yield was recorded five times in a year (up to 28-06-20).

Table 37: Fresh fodder yield of grasses

| Treatment | Fodder yield (t. ha ${ }^{-1}$ ) | Soil analysis at the start of study |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | pH ${ }_{\text {s }}$ | $\begin{gathered} \mathbf{E C}_{\mathbf{e}} \\ \left(\mathrm{dSm}^{-1}\right) \end{gathered}$ | $\begin{gathered} \text { SAR } \\ \left(\mathrm{mmol} \mathrm{~L}^{-1}\right)^{1 / 2} \end{gathered}$ |
| Mott grass | 7.93 D | 9.96 | 8.55 | 88.08 |
| Para grass | 56.44 B | 9.96 | 8.07 | 87.87 |
| Rhodes grass | 65.47 A | 9.99 | 7.36 | 80.96 |
| Kalar grass | 47.90 C | 9.88 | 7.87 | 76.92 |
| LSD | 5.0474 |  |  |  |

Fodder yield analysis data (Table 37) showed that maximum fodder yield ( 65.47 t . ha ${ }^{-1}$ ) was obtained by rhodes grass followed by para grass ( $56.44 \mathrm{t} . \mathrm{ha}^{-1}$ ). Kalar grass recorded the fodder yield of $47.90\left(\mathrm{t} . \mathrm{ha}^{-1}\right)$, while minimum fodder yield ( $7.93 \mathrm{t} . \mathrm{ha}^{-1}$ ) was observed in mott grass. Maximum mortality rate of tufts was observed in mott grass. Salinity/sodicity significantly reduced the fodder yield of mott grass as compare to its yield potential (1200 to 1500 mond /acre/year of mott grass) in normal soil.

Table 38: Soil analysis after five cuttings

| Treatment | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dSm}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ |
| :--- | :---: | :---: | :---: |
| Mott grass | 9.42 | 7.92 | 69.20 |
| Para grass | 8.93 | 4.53 | 51.74 |
| Rhodes grass | 8.82 | 5.68 | 49.86 |
| Kalar grass | 8.89 | 4.87 | 53.24 |

Post-harvest soil analysis (Table 38) showed that there was significant depreciation in, all salinity and sodicity parameters i.e. $\mathrm{EC}_{\mathrm{e}}, \mathrm{pH}_{\mathrm{s}}$ and, SAR after five cuttings. However, all parameters were above the safe limit in all the fields.

## 12. COLLECTION, MAINTENANCE AND COMPARATIVE BIOMASS PRODUCTION ABILITY OF PERENNIAL GRASSES

Experiment was started with objective to collect, maintain and multiply the grasses germplasm for assuring the availability of material for future research. Moreover, relative biomass production ability of these grasses was investigated in normal soil. Grasses tested were: 1-Blue panic (Panicum Antidotable), 2- Green Panic (Panicum Maximum), 3-Tall Panic (Panicum Virgatum) 4- Survinola, 5- Steria Anceps, 6- Steria Seplanda (Steria Seplanda), 7-Dhalis Grass (Paspalum Dilatatum), 8- Rhodes Grass (Chloris gayana), 9- Elephant Grass (Pennisetum purpureum), 10- Buffel Grass (Cenchrus ciliaris), 11- Ona Grass, 12-Bajra Napier Hybrid, 13Mott Apimatic (Pennesetum Apimecticum), 14- Mott Soft (Pennesetum benthium), 15- Mott grass, 16-Silk Sorghum (Sorghum spp), 17-Sucro Sorghum (Sorghum spp), 18-Vetivar Grass, 19-Lemon Grass, 20- Mott grass (office), 21- Buber Grass, 22- Para gras, 23- Sporobulus arabicus. A normal field was selected and prepared. Experiment was laid out in RCBD with three
replications. Tufts of thirteen grasses were transplanted on 25-1-2018 and nine grasses were transplanted on 20-3-18 depending upon their availability, keeping the R X R distance of 60 cm and P X P distance of 60 cm . One bag of DAP, SOP and half bag of Urea acre ${ }^{-1}$ was applied at land preparation while one bag of Urea acre ${ }^{-1}$ was applied after every harvest. Field was irrigated according to crop requirement. All the agronomic practices were kept uniformly in all the treatments. Growth of all the grasses is in progress and satisfactory. Fresh fodder yield was recorded five times in a year (up to 28-06-20).

Table 39: Fresh fodder yield of perennial grasses (total of five cuttings)

| Grasses | Fodder yield (t. ha ${ }^{-1}$ ) |
| :--- | :---: |
| 1-Blue panic | 24.26 KLM |
| 2-Green Panic | 46.44 HIJ |
| 3-Tall Panic | 22.76 LM |
| 4- Survinola | 92.97 EF |
| 5- Steria Anceps | 41.23 HIJKL |
| 6- Steria Seplanda | 119.49 D |
| 7-Dhalis Grass | 35.43 JKL |
| 8-Rhodes Grass | 54.72 GHI |
| 9- Elephant Grass | 149.55 C |
| 10- Buffel Grass | 19.35 LM |
| 11-Ona Grass | 69.61 G |
| 12-Bajra Napier Hybrid | 143.25 C |
| 13- Mott Apimatic | 151.68 BC |
| 14- Mott Soft | 72.60 FG |
| 15- Mott grass | 172.96 B |
| 16-Silk Sorghum | 45.19 HIJK |
| 17-Sucro Sorghum | 29.75 JKLM |
| 18-Vetivar Grass | 58.28 GH |
| 19-Lemon Grass | 21.52 LM |
| 20- Mott grass (office) | 203.11 A |
| 21- Buber Grass | 12.63 M |
| 22-Para grass | 94.91 E |
| 23- Sporobulus arabicus | 208.39 A |
| LSD | 22.138 |

Fodder yield (Table 39) analysis data showed that maximum fodder yield ( 208.39 t . ha ${ }^{-1}$ ) was obtained by sporobulus arabicus which was statistically at par with mott grass. Minimum fodder yield ( $12.63 \mathrm{t} . \mathrm{ha}^{-1}$ ) was produced by buber grass.

## 13. PERFORMANCE AND QUALITY EVALUATION OF PEARL MILLET GERMPLASM ON SALT AFFECTED SOIL

The experiment was planned to screen out the most salt tolerant lines/varieties of pearl millet. A moderately salt affected field $\left\{\mathrm{pH}_{\mathrm{s}}=8.67-9.10, \mathrm{EC}_{\mathrm{e}}=4.2-6.10(\mathrm{dS} \mathrm{m} ~-~) ~, ~ S A R ~=~ 29.80-43.56 ~\right.$ $\left.\left.\left(m m o l L^{-1}\right)^{1 / 2}\right)\right\}$ was selected, prepared and leveled. Composite soil samples were collected and analyzed for salinity/sodicity. Following lines/varieties of pearl millet were tested; 1. Composite-I, 2. Composite-II, 3. Composite-IV, 4. Wt-Bajra, 5. GJ-Bajra, 6. RCBK-948, 7. Y-84, 8. CZK-923, 9. Q-Bajra, 10. BS-2000, 11. Sgd Bajra 2011, 12. MB-87. Experiment was laid out in RCBD with three replications having plot size $1.8 \mathrm{~m} \times 5 \mathrm{~m}$. Lines/varieties were sown on 30-8-19. Recommended dose of fertilizers $70-60-37.5 \mathrm{NPK} \mathrm{kg} \mathrm{ha}^{-1}$ was applied. All agronomic and plant protection measures were applied uniformly. Crop was harvested on 12-12-19 and fresh fodder yield data was recorded.

Table 40: Effect of salinity/sodicity on pearl millet germplasm

| VARIETIES/LINES | Yield (t. ha $^{\mathbf{- 1}}$ ) |
| :--- | :---: |
| $\mathrm{T}_{1}=$ Composite-I | 20.73 c |
| $\mathrm{T}_{2}=$ Composite-II | 26.58 a |

| $\mathrm{~T}_{9}=$ Q-bajra | 24.88 ab |
| $\mathrm{T}_{10}=$ BS-2000 | 24.17 b |
| $\mathrm{~T}_{11}=$ Sgd bajra 2011 | 24.01 b |
| $\mathrm{~T}_{12}=$ MB-87 | 5.10 e |
| LSD | 2.2005 |

Results (Table 40) showed that maximum fresh fodder yield ( $26.58 \mathrm{t} . \mathrm{ha}^{-1}$ ) was produced by Composite-II followed by Composite-IV, RCBK-948 and Q-bajra, however all these lines/varieties were statistically at par with each other. Lowest fresh fodder yield ( $5.10 \mathrm{t} . \mathrm{ha}^{-1}$ ) was produced by MB-87.

Table 41: Post-harvest soil analysis after harvesting of pearl millet 2019

| $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}\left(\mathbf{d S} \mathbf{~ m}^{-\mathbf{1}}\right)$ | SAR $\left(\mathbf{m ~ m o l ~ L}^{-1}\right)^{\mathbf{1 / 2}}$ |
| :---: | :---: | :---: |
| $8.62-9.10$ | $3.70-6.00$ | $28.00-40.68$ |

Soil analysis data (Table 41) showed that $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR were reduced to some extent after harvesting of crop. $\mathrm{pH}_{\mathrm{s}}$ ranges from 8.62-9.10, $\mathrm{EC}_{\mathrm{e}}$ ranges from 3.70-6.00 $\left(\mathrm{dSm}^{-1}\right)$ and SAR ranges from 28.00-40.68.

## 14. EFFECT OF SALT STRESS ON YIELD AND QUALITY PARAMETERS OF SORGHUM GERMPLASM

The experiment was planned to screen out the most salt tolerant lines/varieties of sorghum. A moderately salt affected field $\left\{\mathrm{pH}_{\mathrm{s}}=8.65-8.98, \mathrm{EC}_{\mathrm{e}}=4.60-7.30\left(\mathrm{dS} \mathrm{m} ~{ }^{-1}\right), \mathrm{SAR}=30.50-51.00\right.$ $\left.\left.\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}\right)\right\}$ was selected, prepared and leveled. Composite soil samples were collected and analyzed for salinity/sodicity. Following lines/ varieties of sorghum were tested; 1. YS-98, 2. Sgd- 013-1, 3. Sgd-013-2,4. Sorghum-2011, 5. Hegari, 6. JS-2002, 7. No.1572, 8. No.80010, 9. I-6, 10. PVK-801, 11.FRI-07, 12.S-145. Experiment was laid out in RCBD with three replications having plot size $1.8 \mathrm{~m} \times 5 \mathrm{~m}$. Recommended dose of fertilizers $80-57-37.5 \mathrm{NPK} \mathrm{kg}$ $\mathrm{ha}^{-1}$ was applied. Lines/varieties were sown on 30-8-19. All agronomic and plant protection measures were applied uniformly. Crop was harvested on 31-10-19 and fresh fodder yield data was recorded.

Table 42: Effect of salinity/sodicity on sorghum germplasm

| VARIETIES/LINES | Yield (t. ha ${ }^{\mathbf{- 1}}$ ) |
| :--- | :---: |
| $\mathrm{T}_{1}=$ YS-98 | 25.10 AB |
| $\mathrm{T}_{2}=$ Sgd-013-1 | $22.40 \quad \mathrm{C}$ |
| $\mathrm{T}_{3}=$ Sgd-013-2 | 19.10 |
| $\mathrm{~T}_{4}=$ Sorghum-2011 | 10.400 |
| $\mathrm{~T}_{5}=$ Hegari | E |
| $\mathrm{T}_{6}=$ JS-2002 | 17.60 |
| $\mathrm{~T}_{7}=$ No.1572 | 9.80 |
| $\mathrm{~T}_{8}=$ No.80010 | E |
| $\mathrm{T}_{9}=\mathrm{I}-6$ | 24.40 AB |
| $\mathrm{T}_{10}=$ PVK-801 | 24.40 AB |
| $\mathrm{T}_{11}=$ FRI-07 | 9.10 |
| $\mathrm{~T}_{12}=$ S-145 | 25.60 A |
| LSD | $23.80 \quad \mathrm{BC}$ |

Results (Table 42) showed that maximum fresh fodder yield ( $25.60 \mathrm{t} . \mathrm{ha}^{-1}$ ) was produced by PVK-801 followed by YS-98, S-145 and No.80010, however, all these lines/varieties were statistically at par with each other. Lowest fresh fodder yield ( $9.10 \mathrm{t} . \mathrm{ha}^{-1}$ ) was produced by I-6.

Table 43: Post-harvest soil analysis after harvesting of sorghum 2019

| pH | $\mathrm{EC}_{\mathrm{e}}\left(\mathbf{d S ~ m} \mathrm{m}^{-1}\right.$ ) | SAR ( $\left.\mathrm{m} \mathrm{mol} \mathrm{L}^{-1}\right)^{1 / 2}$ |
| :---: | :---: | :---: |
| 8.55-8.93 | 3.57-6.23 | 29.03-56.57 |

Soil analysis data (Table 43) showed that $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR were reduced to some extent after harvesting of crop. $\mathrm{pH}_{\mathrm{s}}$ ranges from 8.55-8.93, $\mathrm{EC}_{\mathrm{e}}$ ranges from 3.57-6.23 $\left(\mathrm{dSm}^{-1}\right)$ and SAR ranges from 29.03-56.57.

## 15. COMPARATIVE PERFORMANCE OF RHODES GERMPLASM UNDER SALINE SODIC ENVIRONMENT

A field study was conducted to study the performance and quality evaluation of Rhodes varieties in saline sodic soil under field condition. A salt affected field was selected, prepared and leveled. Composite soil samples were collected and analyzed for salinity/sodicity. Rhodes's varieties tested were; 1. Tolgor, 2. Sabre, 3. Fine cut, 4. Toro, 5. Reclaimer, 6. Kotombra. Experiment was laid out in RCBD with three replications. Tufts of grasses were planted in November 2018 according to treatment plan. One bag of DAP and SOP and half bag of Urea/acre was applied at land preparation while one bag of Urea/acre was applied after every harvest (three months). Fresh fodder yield was recorded six times in a year (up to 28-06-20).

Table 45: Initial Soil Analysis

| varieties | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}\left(\mathbf{d S m}^{\mathbf{- 1}}\right)$ | $\mathbf{S A R}$ <br> $(\mathbf{m m o l ~ L}$ <br> $\mathbf{- 1})^{\mathbf{1 / 2}}$ |
| :--- | :---: | :---: | :---: |
| Tolgor | 8.89 | 8.12 | 59.45 |
| Sabre | 8.58 | 10.63 | 51.65 |
| Fine cut | 8.75 | 9.40 | 51.92 |
| Toro | 8.88 | 8.74 | 73.90 |
| Reclaimer | 8.64 | 10.27 | 49.06 |
| Kotombra | 8.89 | 7.57 | 54.43 |

Table 46: Fresh fodder yield of (total of six cuttings)

| Grasses | Fodder yield (t. ha ${ }^{-1}$ ) |
| :--- | ---: |
| Tolgor | $64.92 \quad \mathrm{C}$ |
| Sabre | $78.66 \quad \mathrm{~B}$ |
| Fine cut | $55.20 \quad \mathrm{C}$ |
| Toro | 89.71 A |
| Reclaimer | 56.47 C |
| Kotombra | 56.83 C |
| LSD | 10.059 |

Fodder yield analysis data (Table 46) showed that maximum fodder yield ( $89.71 \mathrm{t} . \mathrm{ha}^{-1}$ ) was produced by Toro followed by Sabre. While, minimum fodder yield ( 55.20 t . ha ${ }^{-1}$ ) was produced by Fine cut.

Table 47: Post-harvest soil analysis after six cuttings

| $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}} \mathbf{( \mathbf { d S } \mathbf { ~ m } ^ { \mathbf { - 1 } } )}$ | SAR $(\mathbf{m ~ m o l ~ L}$ |
| :---: | :---: | :---: | $\mathbf{~}^{\mathbf{- 1})^{1 / 2}}$.

Soil analysis data (Table 47)showed that $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR were reduced to some extent after six cuttings. However, all parameters were above the safe limit in all the fields. $\mathrm{pH}_{\mathrm{s}}$ ranges from 8.55-8.86, $\mathrm{EC}_{\mathrm{e}}$ ranges from 6.73-8.87 $\left(\mathrm{dSm}^{-1}\right)$ and SAR ranges from 48.60-71.42.

## 16. RESPONSE OF RYE GRASS UNDER DIFFERENT LEVELS OF SALINITY AND SODICITY

The experiment was planned to study the performance of rye grass against different salinity and sodicity levels in pots and then performance will be evaluated under field conditions. A normal soil was selected and the desired salinity/sodicity levels were developed using salts NaCl , $\mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}$. After establishing, desired levels of $\mathrm{EC}_{\mathrm{e}}\left(6,12\right.$ and $\left.18 \mathrm{dSm}^{-1}\right)$ and SAR (25, 35 and 45), the soil was filled in the glazed pots as per treatment plan. Seed of ryegrass were sown in 15-10-2019. Experiment was laid out in CRD with three replications. Fresh fodder yield was recorded five times in a season (up to 20-04-20).

Table 48: Effect of salinity/sodicity on fresh fodder yield of rye grass (total of five cuttings)

| Treatments | Desired $\mathrm{EC}_{\mathrm{e}}$ <br> (dSm ${ }^{-1}$ ) | Desired SAR $\left(\mathbf{m m o l ~ L}^{-1}\right)^{1 / 2}$ | $\begin{aligned} & \underset{\text { Developed }}{ } \mathbf{E C}_{\mathrm{e}}\left(\mathrm{dSm}^{-1}\right) \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { SAR }\left(\mathrm{mmol} \mathrm{~L}^{-1}\right)^{1 / 2} \\ & \text { Developed } \end{aligned}$ | Yield (g pot ${ }^{-1}$ ) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ | <4 | $<15$ | 3.41 | 16.16 | 764.00 A |
| $\mathrm{T}_{2}$ | 6 | 25 | 5.56 | 27.99 | 543.00 B |
| $\mathrm{T}_{3}$ | 6 | 35 | 5.78 | 39.79 | 439.00 C |
| $\mathrm{T}_{4}$ | 6 | 45 | 5.20 | 46.85 | 379.00 DE |
| $\mathrm{T}_{5}$ | 12 | 25 | 11.47 | 23.27 | 398.00 D |
| $\mathrm{T}_{6}$ | 12 | 35 | 10.17 | 37.99 | 369.00 DE |
| $\mathrm{T}_{7}$ | 12 | 45 | 12.33 | 50.35 | 213.00 G |
| $\mathrm{T}_{8}$ | 18 | 25 | 11.60 | 23.16 | 350.00 E |
| $\mathrm{T}_{9}$ | 18 | 35 | 13.80 | 31.54 | 278.00 F |
| $\mathrm{T}_{10}$ | 18 | 45 | 13.93 | 46.19 | 163.00 H |
| LSD |  |  |  |  | 34.013 |

Fodder yield analysis data (Table 48) showed that maximum fodder yield ( $764 \mathrm{~g} / \mathrm{pot}$ ) was produced in control, whereas dual stress of salinity and sodicity decreased the fodder yield of rye grass and minimum fodder yield ( $163 \mathrm{~g} /$ pot ) was produced at the highest level of $\mathrm{EC}_{\mathrm{e}}\left(18 \mathrm{dSm}^{-1}\right)$ + SAR (45).

### 5.4 PLANT NUTRITION DIVISION

## 17. FERTILIZER REQUIREMENTS OF SALT TOLERANRT FINE ADVANCE RICE LINES IN SALINE-SODIC SOIL

The experiment was conducted to determine optimum rate of NPK for salt tolerant fine advance rice lines in saline-sodic soil. Two advance fine rice lines SRI 23 and SRI 25 were tested with different fertilizer application rates i.e. $\mathrm{T}_{1} 0-0-0, \mathrm{~T}_{2} 0-86-60, \mathrm{~T}_{3} 75-86-60, \mathrm{~T}_{4}$ 150-86-60, $\mathrm{T}_{5}$ 225-86-60, $\mathrm{T}_{6} 150-0-60, \mathrm{~T}_{7} 150-43-60, \mathrm{~T}_{8} 150-129-60, \mathrm{~T}_{9} 150-86-0, \mathrm{~T}_{10} 150-86-30, \mathrm{~T}_{11} 150-$ 86-90 NPK kg ha ${ }^{-1}$. A moderately saline-sodic field $\left\{\mathrm{pH}_{\mathrm{s}}, 8.65 \mathrm{EC}_{\mathrm{e}} 5.73 \mathrm{dS} / \mathrm{m}\right.$, SAR 35.19 $(\mathrm{mmol} / \mathrm{L})^{1 / 2}$, O.M $0.40(\%)$, available P $8.20 \mathrm{mg} / \mathrm{kg}$, and extractable $106.70 \mathrm{mg} / \mathrm{kg}$ \} was selected. Field was prepared and leveled. Experiment was conducted according to split plot design. Fertilizer rates were kept in sub plot, while rice Advanced lines were kept in main plot. Sub plot size was $6 \mathrm{~m} x 4 \mathrm{~m}$. Whole $\mathrm{P}, \mathrm{K}$ and $1 / 3 \mathrm{~N}$ was applied at the time of rice transplanting, while remaining N was applied in two splits i.e. 25 and 45 days after transplanting. Data regarding paddy yield was recorded at maturity. Results (Table 49) showed that different rates of fertilizer application have significant effect on paddy yield of rice advance lines. Maximum paddy yield ( $2.82 \mathrm{t} / \mathrm{ha}$ ) of both rice advance lines was recorded in the treatment where NPK was applied @ $225-86-60 \mathrm{~kg} / \mathrm{ha}$ and it remained statistically non-significant with NPK application rate @ 150-$129-60 \mathrm{~kg} / \mathrm{ha}$ producing paddy yield ( $2.68 \mathrm{t} / \mathrm{ha}$ ). Minimum paddy yield ( $1.05 \mathrm{t} / \mathrm{ha}$ ) was observed in control treatment without NPK application. Both varieties differed significantly from each other, Advance line SRI-25 gave higher yield than SRI-23. Interaction between Fertilizer application rates and advance rice lines was significant. Maximum paddy yield of advance line SRI-25 (2.94 t/ha) was observed at fertilizer application rate $225-86-60 \mathrm{NPK} \mathrm{kg} / \mathrm{ha}$ and it differed non-significantly with advance lines SRI-23 at same fertilizer application rate producing ( $2.71 \mathrm{t} / \mathrm{ha}$ ) paddy yield. Minimum paddy yield ( $0.98 \mathrm{t} / \mathrm{ha}$ ) and ( $1.11 \mathrm{t} / \mathrm{ha}$ ) was produced by SRI23 and SRI-25 advance rice lines respectively in control treatment without fertilizer application.

Table 49: Effect of different treatments of NPK application on paddy yield of two advance salt tolerant rice lines

| Treatments (NPK kg ha | Variety SRI 23 | Variety SRI 25 | Mean |

| $\mathrm{T}_{9}(150-86-0)$ | 0.50 | 0.51 | 9.20 | 9.13 | 106.20 | 102.40 |
| $\mathrm{T}_{10}(150-86-30)$ | 0.52 | 0.51 | 9.16 | 9.00 | 114.30 | 112.76 |
| $\mathrm{T}_{11}(\mathbf{1 5 0 - 8 6 - 9 0 )}$ | 0.56 | 0.52 | 9.06 | 9.13 | 116.0 | 110.0 |

Salinity /Sodicity parameters of soil decreased slightly (Table 50) after rice harvest and there was better built up in fertility parameters of soils (Table-51) with increasing rates of NPK application.

## 18. RESPONSE OF SUNFLOWER TO BORON APPLICATION IN SALINE SODIC SOIL

Boron has ability to improve sunflower yield due to improved $\mathrm{K} / \mathrm{Na}$ ratio under salt stress condition. The experiment was planned to determine the optimum level of boron for yield improvement of sunflower in saline-sodic soil. A moderately saline-sodic field $\left\{\mathrm{pH}_{s} 8.65, \mathrm{EC}_{\mathrm{e}}\right.$ $6.35 \mathrm{dS} \mathrm{m}^{-1}$, SAR $36.99\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$, O.M. $0.36 \%$, available P $6.46 \mathrm{mg} \mathrm{kg}^{-1}$, extractable K $88.73 \mathrm{mg} \mathrm{kg}^{-1}$ and available B $0.22 \mathrm{mg} \mathrm{kg}{ }^{-1}$ \} was selected. Soil samples were collected and analysed for $\mathrm{pH}_{5}, \mathrm{EC}_{e}, \mathrm{SAR}, \mathrm{O} . M$. available P , extractable K and available B. Field was prepared and leveled. Sunflower crop was sown on ridges in wattar condition keeping ridge to ridge distance 75 cm and plant to plant distance 23 cm . Recommended dose of fertilizer was applied @

125-75-60 NPK $\mathrm{kg} \mathrm{ha}^{-1}$. Whole $\mathrm{P}, \mathrm{K}, \mathrm{B}$ and $1 / 2 \mathrm{~N}$ was applied at the time of sowing and remaining $1 / 2 \mathrm{~N}$ was applied at flowering stage. Source of B was Boric acid. Tested variety was FH -331. Experimental Design was RCBD with three replications. Crop was harvested at maturity. Data of Achene yield was recorded. Post-harvest soil samples were analysed for $\mathrm{pH}_{s}$, $E C_{e}$, SAR and available B. The results are described as under:

Table 52: EFFECT OF DIFFERENR RATES OF BORON APPLICATION ON ACHENE YIELD OF SUNFLOWER (2019)

| TREATMENTS | ACHENE YIELD (t. $\mathrm{ha}^{-1}$ ) |
| :--- | :---: |
| $\mathrm{T}_{1}$ Control (without B application) | 0.791 D |
| $\mathrm{T}_{2}$ B application @ 1.0 $\mathrm{kg} \mathrm{ha}^{-1}$ | 0.831 D |
| $\mathrm{T}_{3}$ B application @ $\mathrm{kg} \mathrm{ha}^{-1}$ | 0.918 C |
| $\mathrm{T}_{4}$ B application @ 2.0 $\mathrm{kg} \mathrm{ha}^{-1}$ | 0.961 BC |
| $\mathrm{T}_{5}$ B application @ 2.5 $\mathrm{kg} \mathrm{ha}^{-1}$ | 1.005 B |
| $\mathrm{~T}_{6}$ B application @ $3.0 \mathrm{~kg} \mathrm{ha}^{-1}$ | 1.077 A |
| LSD | 0.0608 |

Different treatments of boron application have significant effect on achene yield of sunflower. Results (Table 52) showed that boron application increased achene yield of sunflower. Maximum Achene yield ( 1.077 t . $\mathrm{ha}^{-1}$ ) was observed in $\mathrm{T}_{6}$ where B was applied @ $3.0 \mathrm{~kg} \mathrm{ha}^{-1}$ and it was followed by boron application rate $2.5 \mathrm{~kg} \mathrm{ha}^{-1}$ producing achene yield 1.005 t . ha ${ }^{-1}$ (Table 5). Minimum Achene yield ( $0.791 \mathrm{t} . \mathrm{ha}^{-1}$ ) was recorded in control treatment without boron application where only recommended dose of fertilizer was applied.

Table 53: SOIL ANALYSIS AFTER HARVEST OF SUNFLOWER (2019)

| TREATMENTS | pHs | ECe <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | Available B <br> $\left(\mathrm{mg} \mathrm{kg}^{-1}\right)$ |
| :--- | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{1}$ Control (without application) | 8.64 | 6.33 | 32.94 | 0.22 |
| $\mathrm{~T}_{2}$ B application @ 1.0 $\mathrm{kg} \mathrm{ha}^{-1}$ | 8.64 | 6.32 | 30.77 | 0.28 |
| $\mathrm{~T}_{3}$ B application @ 1.5 $\mathrm{kg} \mathrm{ha}^{-1}$ | 8.63 | 6.31 | 32.06 | 0.36 |
| $\mathrm{~T}_{4}$ B application @ 2.0 $\mathrm{kg} \mathrm{ha}^{-1}$ | 8.62 | 6.30 | 31.84 | 0.40 |
| $\mathrm{~T}_{5}$ B application @ 2.5 $\mathrm{kg} \mathrm{ha}^{-1}$ | 8.62 | 6.30 | 31.81 | 0.44 |
| $\mathrm{~T}_{6}$ B application @ 3.0 $\mathrm{kg} \mathrm{ha}^{-1}$ | 8.62 | 6.29 | 31.31 | 0.46 |

Soil analysis after sunflower harvest (Table 53) showed that salinity/sodicity parameters of the soil decreased and there was better built up of boron with increasing rates of boron application in soil.

## 19. INVESTIGATION OF SALT TOLERANCE OF POMEGRANATE UNDER SALINE SODIC CONDITIONS

The objective of study was to investigate salt tolerance potential of pomegranate saplings under saline-sodic soil conditions. A normal sandy loam soil wasselected and characterize for $\mathrm{EC}_{\mathrm{e}}, \mathrm{pH}_{s}$, SAR, organic matter, available P, extractable K and soil texture. Desired Salinity/Sodicity levels were developed artificially using $\mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{NaCl} . \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}$ using quadratic equation.

Tested varieties of pomegranate were Sahiwal Red and Sahiwal white. Earthen pots of 10 kg capacity were filled with soil after developing desired salinity/sodicity levels. Six month old one sapling per pot was planted. One percent urea solution will be applied after every six month. Experimental Design CRD with three replications. Data regarding Plant height, stem girth, No. of branches and leaf per plant recorded after the plantation of saplings and after every six months. Leaves samples will be analyzed for $\mathrm{N}, \mathrm{P}, \mathrm{K}, \mathrm{Na}, \mathrm{Ca}$ and Mg after every six months and same elements will be determined from leaves, stem and roots after three year.

Table 55: Base line data of Sahiwal red variety of pomegranate

| Treatments | Stem girth <br> $(\mathbf{c m})$ | Plant Height <br> $(\mathbf{c m})$ | No.of <br> branches/plant |
| :--- | :---: | :---: | :---: |
| T1 EC< 4.0, SAR< 15 | 0.86 | 83.0 | 4.66 |

## 20. FEASIBILITY OF GROWING QUINOA IN SALT AFFECTED SOIL WITH BRACKISH WATER

The experiment was conducted to check the performance of quinoa in highly\{ pHs 8.80 EC $7.62 \mathrm{dS} \mathrm{m}^{-1}$, SAR $36.14\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$, O.M. $0.35 \%$, Available P $6.80 \mathrm{mg} \mathrm{kg}^{-1}$ and Extractable K $\left.5.8598 .0 \mathrm{mg} \mathrm{kg}^{-1}\right\}$ and moderately salt affected soil \{ $\mathrm{pHs} 8.56 \mathrm{EC} 5.85 \mathrm{dS} \mathrm{m}^{-1}$, SAR 24.60 $\left(\mathrm{mmol} \mathrm{L}{ }^{-1}\right)^{1 / 2}$, O.M. $0.46 \%$, Available P $8.80 \mathrm{mg} \mathrm{kg}^{-1}$ and Extractable K $112.0 \mathrm{mg} \mathrm{kg}^{-1}$ \} with brackish water $\left\{\right.$ EC $1.35 \mathrm{dS} \mathrm{m}^{-1}$, SAR $8 . .06\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ and RSC $\left.6.40 \mathrm{meL}^{-1}\right\}$. Field were
leveled and prepared. Quinoa varieties were sown with ridge sowing technique. Ridge to ridge distance was 45 cm and plant to plant distance was 30 cm . Seed rate was $7.0 \mathrm{~kg} \mathrm{ha}^{-1}$. Fertilizers were applied @ 100-75-60 NPK kg ha ${ }^{-1}$. Whole P , K , and $1 / 2 \mathrm{~N}$ was applied at the time of sowing, while remaining $1 / 2 \mathrm{~N}$ was applied at first irrigation. Crop was harvested at maturity. Grain yield data was recorded (Table 6). After the harvest of quinoa, soil samples were collected and analyzed for $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}, \mathrm{SAR}, \mathrm{OM}$, available P and K . Experimental Design was RCBD with three replications.

Table 57: Grain yield of quinoa varieties at medium and high soil salinity

| Varieties | Medium Salinity level <br> $\mathbf{E C}\left(\mathbf{5 . 8 5 d S} \mathbf{~ m}^{\mathbf{- 1}}\right)$ | $\left.\begin{array}{c}\text { High Salinity Level } \\ \mathbf{E C}(\mathbf{7 . 6 2 ~ d S ~ m} \\ \mathbf{- 1}\end{array}\right)$ |
| :---: | :---: | :---: |
| V9 | 1.125 A | 0.625 A |
| V11 | 0.950 B | 0.575 AB |
| V 15 | 0.875 BC | 0.525 AB |
| V45 | 0.900 BC | 0.600 AB |
| V81 | 0.850 BC | 0.550 B |
| V82 | 0.825 C | 0.565 AB |
| LSD | 0.1014 | 0.1052 |

Grain yield of quinoa (Table 57) in medium salinity field ranged from 1.125 to 0.825 t . ha ${ }^{-1}$. Maximum grain yield 1.125 t . ha ${ }^{-1}$ was produced by quinoa line V 9 and it differed significantly with all remaining five lines of quinoa. Quinoa lines V11, V15, V45, and V81 remained statistically at par with each for producing grain yield. Minimum grain yield 0.825 t . ha- was produced by line V82 which remained statistically at par with lines V81, V45 and V15 producing grain yield $0.850,0.900,0.875 \mathrm{t} . \mathrm{ha}^{-1}$ respectively. Grain yield of quinoa at high salinity field ranged from 0.625 to 0.525 t . ha ${ }^{-1 .}$ Maximum grain yield 0.625 t . ha ${ }^{-1}$ was produced by quinoa line V9 and it differed non significantly with quinoa lines V11, V15, V45 and V82 and significantly with line V81 line of quinoa. Quinoa lines V11, V15, V45, V81 and V82 remained statistically at par with each kfor producing grain yield. Minimum grain yield 0.525 t . $\mathrm{ha}{ }^{-1}$ was produced by line V15 which remained statistically at par with all remaining five lines of quinoa.

TABLE 58: Post harvest soil analysis of medium salinity field

| V45 | 8.51 | 5.73 | 23.56 | 0.57 | 10.46 | 120.26 |
| V81 | 8.51 | 5.72 | 23.24 | 0.58 | 10.73 | 118.80 |
| V82 | 8.50 | 5.70 | 23.10 | 0.59 | 10.86 | 118.06 |

TABLE 59: Post harvest soil analysis of high salinity field

| Varieties | pHs | ECe <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}$ | O.M. <br> $(\%)$ | Available <br> $\mathrm{P}\left(\mathrm{mg} \mathrm{kg}^{-1}\right)$ | Extractable <br> $\mathrm{K}\left(\mathrm{mg} \mathrm{kg}^{-1}\right)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| V 9 | 8.69 | 7.58 | 35.19 | 0.40 | 8.73 | 104.13 |
| V 11 | 8.67 | 7.57 | 34.93 | 0.44 | 8.93 | 105.36 |
| V15 | 8.67 | 7.54 | 34.75 | 0.45 | 9.00 | 107.43 |
| V45 | 8.66 | 7.55 | 35.58 | 0.41 | 8.53 | 102.60 |
| V81 | 8.66 | 7.57 | 36.01 | 0.40 | 8.40 | 101.93 |
| V82 | 8.66 | 7.56 | 35.36 | 0.39 | 8.53 | 103.70 |

Soil analysis after harvesting of quinoa (Table $58 \& 59$ ) showed that salinity / sodicity parameters of soil decreased and there was slight improvement in fertility parameters of the soil.

## 21. RESPONSE OF CANOLA TO SULPHUR AP\{PLICATION IN SALINE SODIC SOIL

The objective of this study was to determine optimum rate of sulphur for yield improvement of canola in saline- sodic soil. The experiment consisted of five treatments T1: NPK @ 80-60-60 $\mathrm{kg} \mathrm{ha}{ }^{-1}$, T2: R.D. $+\mathrm{S} @ 10 \mathrm{~kg} \mathrm{ha}^{-1}$, T3: R.D. $+\mathrm{S} @ 15 \mathrm{~kg} \mathrm{ha}^{-1}$, T4: R.D. $+\mathrm{S} @ 20 \mathrm{~kg} \mathrm{ha}^{-1}$ and T5: R.D. $+\mathrm{S} @ 25 \mathrm{~kg} \mathrm{ha}^{-1}$. Moderately salt affected field $\left(\mathrm{pH}_{\mathrm{s}} 8.63, \mathrm{EC}_{\mathrm{e}} 5.65 \mathrm{dS} \mathrm{m}{ }^{-1}\right.$, SAR $27.16\left(\mathrm{mmmolL}^{-1}\right)^{1 / 2}$, O.M. $0.42 \%$, Available $\mathrm{P} 8.40 \mathrm{mg} \mathrm{kg}^{-1}$, extractable $\mathrm{K} 110 \mathrm{mg} \mathrm{kg}^{-1}$, Sulphate sulphur $6.80 \mathrm{mg} \mathrm{kg}^{-1}$ and soil texture sandy loam was selected. Field was leveled and prepared in wattar condition. Treatments were applied according to treatment plan. Seed rate was $5.0 \mathrm{~kg} \mathrm{ha}^{-1}$. Fertilizers were applied @ $80-60-60 \mathrm{~kg} \mathrm{ha}^{-1}$. Whole $\mathrm{P}, \mathrm{K}$, and S were applied at the time of sowing, while N was applied in two splits. i.e. $1 / 2 \mathrm{~N}$ at first irrigation and remaining $1 / 2 \mathrm{~N}$ was applied at flowering stage. Crop was harvested at maturity. Data regarding grain yield was recorded. Experimental design was RCBD with tree replications. Plot size was $5 \mathrm{~m} x$ 4 m . The source of S was gypsum ( $18.60 \% \mathrm{~S}$ )

Table 60: Effect of different rates of sulphur on grain yield of canola

| Treatments | Grain yield <br> $\left(\mathbf{t .}\right.$ ha $\left.^{-1}\right)$ |
| :--- | :---: |
| $\mathrm{T}_{1}\left(80-60-60 \mathrm{NPK} \mathrm{kg} \mathrm{ha}^{-1}\right)$ | 0.56 D |
| $\mathrm{T}_{2}$ (R.D. +S @ $\left.10 \mathrm{~kg} \mathrm{ha}^{-1}\right)$ | 0.63 CD |
| $\mathrm{T}_{3}$ (R.D. +S @ $\left.15 \mathrm{~kg} \mathrm{ha}^{-1}\right)$ | 0.74 BC |
| $\mathrm{T}_{4}\left(\right.$ R.D. +S @ $\left.20 \mathrm{~kg} \mathrm{ha}^{-1}\right)$ | 0.86 AB |
| $\mathrm{T}_{5}\left(\right.$ R.D. + S @ $\left.25 \mathrm{~kg} \mathrm{ha}^{-1}\right)$ | 0.91 A |
| LSD | 0.1230 |

Different treatments of sulphur application have significant effect on grain yield of canola. Maximum grain yield of canola 0.91 t . $\mathrm{ha}^{-1}$ was recorded in the treatment where $\mathrm{S} @ 25 \mathrm{~kg} \mathrm{ha}{ }^{-1}$ with recommended dose of NPK was applied and it remained statistically at par with S rate applied @ $20 \mathrm{~kg} \mathrm{ha}^{-1}$ producing canola yield 0.86 t . ha ${ }^{-1}$. Minimum grain yield of canola 0.56 t . $\mathrm{ha}^{-1}$ was observed in control treatment where only recommended dose of NPK was applied without $S$ application (Table 60).

## 22. EFFECT OF TRANSPLANTING DATES ON THE YIELD OF FINE GRAIN RICE LINES IN SALT AFFECTED SOILS

Study was conducted with objective to determine the transplanting date of new fine grain rice lines for getting optimum yield in salt affected soils. A salt affected field ( $\mathrm{pH}=8.75, \mathrm{EC}=5.33$ $(\mathrm{dS} / \mathrm{m})$ and $\left.\mathrm{SAR}=35.49(\mathrm{mmol} / \mathrm{L})^{1 / 2}\right)$ was selected. The experiment was laid out in split plot design with three replications. rice varieties were kept in main plot and sowing date in sub-plots. Treatments included were A; Varieties (SRI-23, SRI-25) B; Sowing dates ( $1^{\text {st }}$ June, 15 June, $1^{\text {st }}$ July, 15 July). Recommended dose of fertilizers ( $150-85-60 \mathrm{NPK} \mathrm{kg} \mathrm{ha}^{-1}$ ) was applied to rice. The rice varieties were transplanted on different sowing dates according to the layout plan. All agronomic and plant protection measures were applied uniformly. Crop was harvested on 29-102019and paddy yield data was recorded.

Table 62: Effect of different transplanting dates on rice varieties 2019

| Treatments | SRI-25 | SRI-23 | Mean |
| :---: | :---: | :---: | :---: |
| $\mathbf{1}^{\text {st }}$ June | 2.81 ABC | $2.43 \quad \mathrm{C}$ | 2.62 B |
| $\mathbf{1 5 ~ J u n e ~}^{\mathbf{1}^{\text {st }} \text { July }}$ | 2.96 ABC | $2.50 \quad \mathrm{BC}$ | 2.73 AB |
| $\mathbf{1 5 ~ J u l y ~}_{\text {Mean }}$ | 3.19 A | 2.77 ABC | 2.98 A |
|  | 2.97 AB | 2.69 ABC | 2.83 AB |

The results (Table 62) indicated that the maximum paddy yield ( $3.19 \mathrm{t} / \mathrm{ha}$ ) was recorded from SRI-25and where crop was sown on $1^{\text {st }}$ July which was statistically similar to transplanting date of 15 July ( $2.97 \mathrm{t} / \mathrm{ha}$ ) and SRI-23,sown on $1^{\text {st }}$ July and 15 July. Among the varieties, SRI-25 gave more paddy yield ( $2.98 \mathrm{t} / \mathrm{ha}$ ) when compared with SRI-23. Similarly, $1^{\text {st }}$ July produced higher paddy yield ( $2.98 \mathrm{t} / \mathrm{ha}$ ) followed by 15 July ( $2.83 \mathrm{t} / \mathrm{ha}$ ). The minimum paddy yield ( $2.62 \mathrm{t} / \mathrm{ha}$ ) was obtained where crop was sown on $1^{\text {st }}$ June.

Table 63: Soil analysis after rice 2019

| Treatments | SRI-25 |  |  | SRI-23 |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | $\mathrm{pH}_{\mathrm{s}}$ | $\mathrm{EC}_{\mathrm{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | $\mathrm{SAR}^{2}$ <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | $\mathrm{pH}_{\mathrm{s}}$ | $\mathrm{EC}_{\mathrm{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ |
| $\mathbf{1}^{\text {st June }}$ | 8.73 | 5.20 | 32.60 | 8.74 | 5.22 | 32.63 |
| $\mathbf{1 5}$ June | 8.72 | 5.23 | 32.20 | 8.72 | 5.23 | 32.10 |
| $\mathbf{1}^{\text {st July }}$ | 8.72 | 5.21 | 32.26 | 8.72 | 5.20 | 32.10 |
| 15 July | 8.72 | 5.21 | 32.27 | 8.72 | 5.20 | 32.00 |

In case of soil analysis (Table 63) $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR were above the safe limits in all the treatments.

## 23. INVESTIGATION OF SALT TOLERANCE OF MORINGA SAPLINGS UNDER SALINE SODIC CONDITION

Study was conducted with objective to investigate salt tolerance potential of moringa saplings under saline sodic soil condition. Trial was laid out in CRD design with three replications. A normal soil was selected and the desired salinity / sodicity levels were developed using quadratic equation by adding salts of $\mathrm{NaCl}, \mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}$. Treatments included were combinations of $\mathrm{EC}_{\mathrm{e}}$ and $\operatorname{SAR}(<4,6,912$ and $<13.2,20.30,40$ respectively). After establishing desired levels of $\mathrm{Ec}_{\mathrm{e}}$ and SAR , the soil was filled in 20 kg earthen pots as per treatment plan. Three saplings of two month age were transplanted in each pot and after plant establishment one plant per pot was maintained. All agronomic and plant protection measures were applied uniformly.
Data: All the saplings not survived/ dried in all treatments except control.

## 24. INVESTIGATION OF SALT TOLERANCE POTENTIAL OF MORINGA UNDER SALINE SOIL CONDITION

Study was conducted with objective to investigate salt tolerance potential of direct seeded moringa plants under saline soil condition. Trial was laid out in CRD design with three replications. A normal soil was selected and the desired salinity / sodicity levels were developed using quadratic equation by adding salts of $\mathrm{NaCl}, \mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}$. Treatments included were combinations of $\mathrm{Ec}_{\mathrm{e}}$ and $\operatorname{SAR}$ ( $<4,6,912$ and $<13 \cdot 2,20.30,40$ respectively). After establishing desired levels of $\mathrm{Ec}_{\mathrm{e}}$ and SAR , the soil was filled in 20 kg earthen pots as per treatment plan. Three seeds were planted in each pot and after plant establishment one plant per pot was maintained. All agronomic and plant protection measures were applied uniformly.
Data: germination \%age was below normal in all the pots except in control.

## 25. SCREENING OF SUGAR BEET VARIETIES IN SALINITY BLOCKS AGAINST DIFFERENT SALINITY / SODICITY LEVELS

The experiment was conducted in salinity blocks at Soil Salinity Research Institute, Pindi Bhattian to study the performance of sugar beet varieties against different salinity / sodicity levels. Artificial salinity and sodicity levels were developed in the salinity blocks by adding
calculated quantity of salts i.e. $\mathrm{NaCl}, \mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}$ using quadratic equation. The experiment was laid out in CRD with factorial arrangement having three replications. The treatments included in the experiment were as follows: A). Sugar beet varieties (California, Arnestina, Aranka \& Serenada) and B). Salinity / Sodicity levels (i. $\mathrm{EC}_{\mathrm{e}}<4 \mathrm{dSm}^{-1}+\mathrm{SAR}<15$ $\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}$, ii. $\mathrm{EC}_{\mathrm{e}}=8 \mathrm{dSm}^{-1}+\mathrm{SAR}=20\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}$ and iii. $\mathrm{EC}_{\mathrm{e}}=12 \mathrm{dSm}^{-1}+\mathrm{SAR}=40$ $\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}$ ). Recommended dose of fertilizer (120-70-45 NPK kg ha ${ }^{-1}$ ) was applied to the crop. The crop was planted in each salinity block manually on 22.11.2019. All other agronomic measures were adopted uniformly. The crop was harvested at maturity on 05.05.2020 and data were recorded. The soil samples were also collected after the harvest of crop to determine the change in the $\mathrm{pHs}, \mathrm{EC}_{\mathrm{e}}$ and SAR of the soil. Data regarding the sugar beet yield (Table-1) clearly indicated that the highest yield was recorded in Serenanda ( $97.91 \mathrm{t} \mathrm{ha}{ }^{-1}$ ) which was found statistically at par with Arnestina ( $92.86 \mathrm{t} \mathrm{ha}{ }^{-1}$ ). However California ( $85.73 \mathrm{t} \mathrm{ha}{ }^{-1}$ ) and Aranka ( $79.74 \mathrm{tha}^{-1}$ ) were statistically non-significant. Similarly among the salinity levels, the maximum sugar beet yield was obtained at $\mathrm{EC}_{\mathrm{e}}<4 \mathrm{dSm}^{-1}+\mathrm{SAR}<15\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}$ followed by $\mathrm{EC}_{\mathrm{e}}=8 \mathrm{dSm}^{-1}$ $+\mathrm{SAR}=20\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}$ gave 116.46 and $91.08 \mathrm{t} \mathrm{ha}^{-1}$ respectively. The lowest sugar beet yield $\left(59.64 \mathrm{t} \mathrm{ha}^{-1}\right)$ was obtained at $\left.\mathrm{EC}_{\mathrm{e}}=12 \mathrm{dSm}^{-1}+\mathrm{SAR}=40\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}\right)$.
Table-64: Effect of different salinity/ sodicity levels on the yield (t ha ${ }^{-1}$ ) of different sugar beet varieties in salinity blocks

## 26. PERFORMANCE OF SUGAR BEET VARIETIES ON MODERATELY SALINE SODIC SOIL

The_experiment was planned in collaboration with sugarcane research board (AARI-Faisalabad), Safina Sugar Mill, Lalian (Chiniot) and Soil Salinity Research Institute (Pindi Bhattian). Sugarcane Research Board provided only one variety (Serenada) during the Rabi-2019-20. The trial was conducted at Research Farm, Soil Salinity Research Institute, Pindi Bhattian during the Rabi-2019-20 to check the performance of sugar beet varieties suitable for cultivation in salt affected. For this purpose a moderately saline sodic field $\left(\mathrm{pH}_{\mathrm{s}}=8.67, \mathrm{EC}_{\mathrm{e}}=4.65 \mathrm{dSm}^{-1}\right.$ and $\mathrm{SAR}=$ $\left.36.72 \mathrm{mmolL}^{-1}\right)^{1 / 2}$ ) was selected and well prepared for sowing. The variety was planted on double row beds spaced at 45 cm by maintaining plant to plant distance of 15 cm . The crop was on 21.11.2019. The requisite data were recorded at maturity of the crop. The crop was harvested on 06.05.2020. Table-3 depicted that serenada gave yield of $89.3 \mathrm{t} \mathrm{ha}^{-1}$ under saline-sodic field conditions.

Table-66: Performance of sugar beet variety (Serenada) on moderately saline sodic soil

| Variety | Yield (t/ha) |
| :--- | :---: |
| SERENADA | 89.3 |

Note: During year 2019-20 seed of only one variety (Serenada) was available for field experiment
Table-67: Post harvest soil analyses

| Variety | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}\left(\mathbf{d S m}^{\mathbf{- 1}}\right)$ | SAR $\left(\mathbf{m m o l ~ L}^{\mathbf{- 1}}\right)^{\mathbf{1 / 2}}$ |

| SERENADA | 8.63 | 4.47 | 33.85 |

## 27. YIELD PERFORMANCE OF DIFFERENT WHEAT VARIETIES AS AFFECTED BY VARIOUS SOWING DATES IN SALT AFFECTED SOIL

The experiment was designed to study the performance of wheat varieties to optimize the sowing dates in view of the erratic changes in climate for salt affected soils. The trial was conducted on Research Farm, Soil Salinity Research Institute, Pindi Bhattian during the Rabi 2019-20. A salt affected field was selected and well prepared for sowing of the crop according to the treatment plan. The treatments used in the study were: A). Sowing dates ( 10 November, 20 November, 30 November \& 10 December) and B). Wheat varieties (FSD-08, Johar-16, Anaj-17 \& Ujala-16). The experiment was laid out in split plot design with three replications. Sowing dates were placed in main plots while the wheat varieties were kept in sub plots. The crop was sown with tractor drawn rabi drill. Recommended dose of fertilizer (120-110-70 NPK ha ${ }^{-1}$ ) was applied to each experimental unit. The crop was harvested on 08.05 .2020 and data were recorded. Results presented in the table 5 indicated that the maximum grain yield was obtained where crop was sown on 20 November ( $3.31 \mathrm{t} \mathrm{ha}^{-1}$ ) followed by 10 November ( $3.02 \mathrm{t} \mathrm{ha}{ }^{-1}$ ). However the lowest grain yield was recorded in the crop planted on 10 December ( $1.94 \mathrm{t} \mathrm{ha}{ }^{-1}$ ). The wheat variety FSD-08 out yielded ( $3.05 \mathrm{t} \mathrm{ha}^{-1}$ ) the other varieties. Anaj-17 and Ujala-16 were statistically at par with each other with grain yield of 2.79 and $2.68 \mathrm{t} \mathrm{ha}^{-1}$ respectively. The interactive effect of
sowing dates and wheat varieties was statistically non-significant. Soil samples were also collected and analyzed for $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR. The change in these soil parameters is presented in the table-68.

Table-67: Effect of various sowing dates on the yield performance of different wheat varieties under salt affected soil

### 5.6 ENGINEERING DIVISION

## 28. EFFECT OF DIFFERENT IRRIGATION FREQUENCIES ON DIRECT SEEDED RICE IN SALT AFFECTED SOIL

The trial was conducted to find out the delta of water and irrigation frequencies for direct seeded rice in salt affected soils. For this purpose four irrigation intervals 4 days, 6 days, 8 days and 10 days were studied. Moderately salt affected field as described in table 01 was selected, leveled and prepared. Irrigations were applied using cut-throat flume. The experiment was conducted for rice crop in RCB Design having three replications.

Table 69 :Soil analyses before start of study

| Parameter | Soil Depth (0-15) cm | Soil Depth (15-30) cm |
| :--- | :---: | :---: |
| $\mathrm{pH}_{\mathrm{s}} \quad 8.80$ | 9.01 |  |
| $\mathrm{EC}_{\mathrm{e}} \quad\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | 4.33 | 3.46 |
| SAR $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | 30.15 | 30.77 |
| BD $\left(\mathrm{Mg} \mathrm{m}^{-3}\right)$ | 1.53 | ---- |
| $\mathrm{HC}\left(\mathrm{cm} \mathrm{hr}^{-1}\right)$ | 0.48 | --- |

In kharif season rice crop was sown on $18^{\text {th }}$ June, 2019 and recommended dose of NPK for rice 150-$85-60 \mathrm{~kg} \mathrm{ha}^{-1}$ was applied. Data on paddy was recorded on $25^{\text {th }}$ October, 2019.
Table 70: Effect of Irrigation Frequencies on Paddy and Straw Yield (t ha ${ }^{-1}$ )

| Irrigation Frequency | Paddy <br> Yield <br> (t ha $\left.^{-1}\right)$ | Straw <br> yield <br> $\left(\mathrm{tha}^{-1}\right)$ | No. of <br> Irrigations <br> Applied | Delta of <br> water <br> (Inches) | Water use <br> Efficiency <br> $\left(\mathrm{kg} \mathrm{ha}^{-1} \mathrm{~mm}^{-1}\right)$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| 4 Days | 3.14 B | 6.31 B | 24 | 84.85 | 1.46 |
| 6 Days | 3.39 A | 6.81 A | 15 | 57.85 | 2.31 |
| 8 Days | 3.28 AB | 6.69 AB | 12 | 48.85 | 2.64 |
| 10 Days | 2.45 C | 5.45 C | 8 | 36.85 | 2.62 |
| LSD | 0.2294 | 0.3840 |  |  |  |

Note: Rainfall (12.85 inches) occurred during kharif-2019 is included in delta of water.
Results (table 70) showed that maximum paddy yield ( $3.39 \mathrm{t} \mathrm{ha}^{-1}$ ) was obtained where irrigation was applied after 6 days interval and minimum paddy yield ( $2.45 \mathrm{t} \mathrm{ha}^{-1}$ ) was obtained using irrigation interval of 10 days. However maximum water use efficiency ( $2.64 \mathrm{~kg} \mathrm{ha}^{-1} \mathrm{~mm}^{-1}$ ) was obtained in the treatment where irrigation was applied after 8 days interval which was followed by 10 days irrigation interval i.e. $2.64 \mathrm{~kg} \mathrm{ha}^{-1} \mathrm{~mm}^{-1}$.

Table 71:Soil analysis after harvest of rice crop

| Irrigation Interval | $\mathbf{p H}_{s}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | $\mathbf{S A R}$ <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ |
| :--- | :---: | :---: | :---: |
| 4 Days | 8.72 | 3.08 | 24.20 |
| 6 Days | 8.73 | 3.27 | 25.34 |
| 8 Days | 8.74 | 3.42 | 26.47 |
| 10 Days | 8.75 | 3.69 | 26.95 |

After the harvest of rice crop soil samples were collected to analyze the soil for $\mathrm{EC}_{\mathrm{e}}, \mathrm{pH}_{\mathrm{s}}$ and SAR as shown in table 71. Results indicated that salinity / sodicity parameters have been reduced after harvest of rice crop.

## 29. PERFORMANCE OF BIO-DRAINAGE PLANTS FOR THE UTILIZATION OF SALINE WATER LOGGED SOILS

This experiment was conducted to study the performance of three bio drainage plants in water logged soils as well as for utilization of water logged soils to generate income from barren land. For this purpose three bio-drainage plants were selected to check the performance of these bio-drainage plants. Water logged field was selected and analyzed for salinity sodicity parameters as shown in table 04.

Table 72:Soil analyses before start of study

| Parameter | Soil Depth (0-15) cm |
| :--- | :---: |
| $\mathrm{pH}_{\mathrm{s}}$ | 8.88 |
| $\mathrm{EC}_{\mathrm{e}}\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | 10.32 |
| SAR $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | 65.15 |

Land was prepared and one foot deep furrows were made as per treatment plan. Six month old saplings were transplanted at the shoulders of these furrows. Plant to plant and row to row distance for eucalyptus, arjun and acacia ampliceps was maintained 1.5 m X $1.5 \mathrm{~m}, 2.5 \mathrm{~m} \times 2.5 \mathrm{~m}$ and 2 m X 2 m respectively. Three Piezometers were installed to monitor water table depth of these three bio-drainage plants whereas one piezometer was installed on barren field. Baseline data was recorded on 28.03.2019 after survival of plants as shown in table 05.

Table 73: Baseline data

| Treatments | Plant height <br> $(\mathbf{f t})$ | Plant stem girth <br> $(\mathbf{c m})$ | Water table depth <br> $(\mathbf{f t})$ |
| :--- | :---: | :---: | :---: |
| Eucalyptus | 11.11 | 11.23 | 6.20 |
| Arjun | 2.76 | 3.195 | 6.25 |
| Acacia Ampliceps | 2.11 | 3.46 | 6.17 |
| Barren | - | - | 6.27 |

Table 74: Plant height and Plant stem girth (March 2020)

| Treatments | Plant height <br> $(\mathbf{f t})$ | Plant stem girth <br> $(\mathbf{c m})$ | Water table depth <br> $(\mathbf{f t})$ |
| :--- | :---: | :---: | :---: |
| Eucalyptus | 24.12 A | 23.01 A | 5.79 |
| Arjun | 6.03 C | 9.25 C | 5.86 |
| Acacia Ampliceps | 9.57 B | 13.72 B | 5.77 |
| Barren | - | - | 5.92 |
| LSD | 2.0468 | 3.0043 | - |

Results (table 74) showed that maximum plant growth was observed in eucalyptus plants i.e. maximum plant height of eucalyptus 24.12 feet and plant stem girth 23.01 cm which remained statistically significant with arjun and acacia ampliceps plants. Whereas, minimum water table depth was recorded with the treatment plot of acacia ampliceps plants.

Table 75: $\quad$ Soil analysis (March 2020)

| Treatments | Soil depth (inch) |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{0 - 6}$ | $\mathbf{6 - 1 2}$ | $\mathbf{1 2 - 2 4}$ | $\mathbf{2 4 - 3 6}$ | $\mathbf{3 6 - 4 8}$ |  |  |
|  | $\mathbf{p H}_{\mathbf{s}}$ |  |  |  |  |  |  |
| Eucalyptus | 9.25 | 9.00 | 8.62 | 8.56 | 8.44 |  |  |
| Arjun | 9.33 | 9.05 | 8.67 | 8.65 | 8.51 |  |  |
| Acacia Ampliceps | 9.29 | 9.02 | 8.65 | 8.58 | 8.48 |  |  |
| Barren | 9.37 | 9.16 | 8.79 | 8.72 | 8.65 |  |  |
| Treatments | $\mathbf{E C}_{\mathbf{e}} \quad\left(\mathbf{d S ~ m}^{-1}\right)$ |  |  |  |  |  |  |
| Eucalyptus | 8.55 | 7.85 | 2.96 | 1.69 | 1.63 |  |  |
| Arjun | 9.05 | 8.41 | 2.90 | 2.64 | 1.87 |  |  |
| Acacia Ampliceps | 8.86 | 7.30 | 2.42 | 1.76 | 1.40 |  |  |
| Barren | 9.44 | 8.78 | 3.29 | 2.66 | 2.13 |  |  |
| Treatments | $\mathbf{S A R}\left(\mathbf{m m o l} \mathbf{L}^{-1}\right)^{\mathbf{1 / 2}}$ |  |  |  |  |  |  |
| Eucalyptus | 42.43 | 38.48 | 35.99 | 28.91 | 22.50 |  |  |
| Arjun | 44.60 | 40.06 | 37.97 | 31.81 | 24.31 |  |  |
| Acacia Ampliceps | 43.18 | 39.96 | 36.88 | 26.98 | 23.16 |  |  |
| Barren | 48.89 | 46.65 | 38.64 | 29.07 | 25.90 |  |  |

Soil samples were also collected and analyzed for $\mathrm{pH}_{\mathrm{s}}, \mathrm{EC}_{\mathrm{e}}$ and SAR and results (table 75) depicted that salinity sodicity has be reduced after survival of plants.

## 30. COMPARISON OF DIFFERENT SOWING METHODS FOR IMPROVING YIELD AND WATER USE EFFICIENCY UNDER BRACKISH WATER IRRIGATION

The experiment was conducted to compare the efficacy of different sowing methods for yield and water use efficiency improvement using brackish water in Rice-Wheat rotation. Four sowing methods i.e Broadcast sowing (Flat), Drill sowing (Flat), Ridge Sowing and Bed sowing were used in this research experiment. A normal field (table 08) was selected and prepared for sowing of rice (Shaheen basmati) by direct seeding according to treatment plan. Irrigations were applied using cut throat flume. Number of irrigations for whole season was recorded to calculate the delta of water and ultimately water use efficiency was calculated. Design was RCBD with three repeats having plot size $8 \mathrm{~m} \times 12 \mathrm{~m}$.

Table 76: Soil analyses before start of study

| Parameter | Soil Depth (0-15) cm | Soil Depth (15-30) cm |
| :--- | :---: | :---: |
| $\mathrm{pH}_{\mathrm{s}} \quad 8.21$ | 8.55 |  |
| $\mathrm{EC}_{\mathrm{e}} \quad\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | 1.81 | 1.75 |
| SAR $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | 11.18 | 11.04 |
| $\mathrm{BD}\left(\mathrm{Mg} \mathrm{m}^{-3}\right)$ | 1.44 | ---- |
| $\mathrm{HC}\left(\mathrm{cm} \mathrm{hr}^{-1}\right)$ | 0.79 | --- |

In Kharif season rice crop was sown on $17^{\text {th }}$ June, 2019 and recommended dose of fertilizer for rice150-85-60 N, $\mathrm{P}_{2} \mathrm{O}_{5}, \mathrm{~K}_{2} \mathrm{O} \mathrm{kg} \mathrm{ha}{ }^{-1}$ was applied. Paddy yield data was recorded on $25^{\text {th }}$ October, 2019 as shown in (table 77).

Table 77: Effect of sowing methods on Yield and Water use efficiency

| Sowing Method | Paddy Yield <br> $\left(\mathrm{tha}^{-1}\right)$ | Delta of water <br> (Inches) | Water use Efficiency <br> $\left(\mathrm{kg} \mathrm{ha}^{-1} \mathrm{~mm}^{-1}\right)$ |
| :--- | :---: | :---: | :---: |
| Broadcast Sowing | 3.13 C | 48.85 | 2.52 |
| Drill Sowing | 3.80 A | 48.85 | 3.06 |
| Ridge Sowing | 3.62 AB | 36.85 | 3.87 |
| Bed Sowing | 3.46 B | 28.85 | 4.75 |
| LSD | 0.2373 |  |  |

Note: Rainfall (12.85 inches) occurred during kharif-2019 is included in delta of water.
Results (Table 77) showed that maximum paddy yield ( $3.80 \mathrm{tha}{ }^{-1}$ ) was recorded using Drill sowing method which remained statistically significant with other sowing methods. Whereas, maximum water use efficiency ( $4.75 \mathrm{~kg} \mathrm{ha}^{-1} \mathrm{~mm}^{-1}$ ) was found in the treatment where, bed sowing method was used.

Table 78:Soil analysis after harvest of rice crop

| Sowing Method | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | $\mathbf{S A R}$ <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ |
| :--- | :---: | :---: | :---: |
| Broadcast Sowing | 8.29 | 3.21 | 16.54 |
| Drill Sowing | 8.28 | 2.98 | 15.22 |
| Ridge Sowing | 8.26 | 2.21 | 13.15 |
| Bed Sowing | 8.25 | 1.89 | 12.43 |

After the harvest of rice crop soil samples were collected to analyze the soil for $\mathrm{EC}_{\mathrm{e}}, \mathrm{pH}_{\mathrm{s}}$ and SAR as shown in table 78. Results indicated that salinity / sodicity parameters have been increased in treatment of broadcast sowing and drill sowing method whereas salinity / sodicity parameters have been relatively reduced where ridge sowing and bed sowing methods were used because of less utilization of high RSC water. Moreover 12.85 inches rainfall may have helped to mitigate ill effects of brackish water.

In Rabi season wheat crop was sown on $2^{\text {nd }}$ December, 2019 and recommended dose of fertilizer for wheat $120-110-70$ NPK $\mathrm{kg} \mathrm{ha}^{-1}$ was applied. Wheat grain yield data was recorded on $5^{\text {th }}$ May, 2020 as shown in table 79.

Table 79: Effect of sowing methods on Yield and Water use efficiency
$\left.\begin{array}{|l|c|c|c|}\hline \text { Sowing Method } & \begin{array}{c}\text { Wheat Grain Yield } \\ (\mathrm{t} \mathrm{ha}\end{array} \\ \hline-1)\end{array} \begin{array}{c}\text { Delta of water } \\ (\text { Inches })\end{array} \quad \begin{array}{c}\text { Water use Efficiency } \\ \left(\mathrm{kg} \mathrm{ha}^{-1} \mathrm{~mm}^{-1}\right)\end{array}\right]$

Results (Table 79) showed that maximum wheat grain yield ( $3.67 \mathrm{t} \mathrm{ha}^{-1}$ ) was recorded using Drill sowing method which remained statistically significant with other sowing methods. Whereas, maximum water use efficiency ( $16.63 \mathrm{~kg} \mathrm{ha}^{-1} \mathrm{~mm}^{-1}$ ) was found in the treatment where, bed sowing method was used.

Table 80: Soil analysis after harvest of wheat crop

| Sowing Method | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ |
| :--- | :---: | :---: | :---: |
| Broadcast Sowing | 8.33 | 3.76 | 17.87 |
| Drill Sowing | 8.32 | 3.28 | 16.45 |
| Ridge Sowing | 8.28 | 2.54 | 14.08 |
| Bed Sowing | 8.26 | 2.21 | 13.11 |

After the harvest of wheat crop soil samples were collected to analyze the soil $\mathrm{EC}_{\mathrm{e}}, \mathrm{pH}_{\mathrm{s}}$ and SAR as shown in table 80 . Results indicated that salinity / sodicity parameters have been increased due to application of brackish water.

## 31. LONG TERM EFFECT OF CROP RESIDUE MANAGEMENT USING DIFFERENT TILLAGE PRACTICES ON YIELD AND PHYSICO-CHEMICAL PROPERTIES OF

 MODERATELY SALT AFFECTED SOILSThis study was planned to study the long term effect of crop residue management on yield of wheat-rice system and soil physico-chemical properties of moderately salt affected soils. For this purpose, five treatments were studied i.e (i) Removal of crop residue, (ii) Incorporation of crop residue by disc harrow and MB plough, (iii) Incorporation of crop residue by disc harrow and MB plough + Urea @ $40 \mathrm{~kg} \mathrm{ha}^{-1}$ for decomposition, (iv) Incorporation of crop residue by straw chopper and (v) Incorporation of crop residue by straw chopper + Urea @ 40 kg ha ${ }^{-1}$ for decomposition. A moderately salt affected field as described in table 13 was selected and prepared for the sowing of wheat crop.

Table 81: Soil analyses before start of study

| Parameter | Soil Depth (0-15) cm |
| :--- | :---: |
| $\mathrm{pH}_{\mathrm{s}}$ | 8.79 |
| $\mathrm{EC}_{\mathrm{e}}\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | 5.08 |
| $\mathrm{SAR}\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ | 32.48 |
| $\mathrm{O} . \mathrm{M}(\%)$ | 0.52 |
| $\mathrm{BD}\left(\mathrm{Mg} \mathrm{m}^{-3}\right)$ | 1.52 |
| $\mathrm{HC}\left(\mathrm{cm} \mathrm{hr}^{-1}\right)$ | 0.47 |

In Kharif season transplanting of rice seedling was completed on $17^{\text {th }}$ July, 2019 and recommended dose of fertilizer for rice $150-85-60 \mathrm{~N}, \mathrm{P}_{2} \mathrm{O}_{5}, \mathrm{~K}_{2} \mathrm{Okg} \mathrm{ha}^{-1}$ was applied. Paddy yield data was recorded on $25^{\text {th }}$ October, 2019 as shown in table 82.

Table 82: Effect of crop residue management techniques on Paddy Yield

| Treatments | Paddy Yield <br> $(\mathbf{t ~ h a}$ <br>  <br> $\mathbf{- 1})$ |
| :--- | :---: |
| Removal of crop residue | 2.34 C |
| Incorporation of crop residue by disc harrow and MB plough | 2.41 BC |
| Incorporation of crop residue by disc harrow and MB plough + Urea <br> @ $40 \mathrm{~kg} \mathrm{ha}^{-1}$ for decomposition | 2.57 AB |
| Incorporation of crop residue by straw chopper | 2.48 BC |
| Incorporation of crop residue by straw chopper + Urea @ $40 \mathrm{~kg} \mathrm{ha}^{-1}$ <br> for decomposition | 2.71 A |
| LSD | 0.1864 |

Results showed that maximum paddy yield ( $2.71 \mathrm{t} \mathrm{ha}^{-1}$ ) was recorded where incorporation of crop residue was done by straw chopper + Urea @ $40 \mathrm{~kg} \mathrm{ha}^{-1}$ which remained statistically significant with other crop residue management techniques. Whereas, minimum paddy yield ( $2.34 \mathrm{t} \mathrm{ha}^{-1}$ ) was recorded in removal of crop residue treatment (Table 82).

Table 83: Soil analysis after harvest of rice crop

| Treatments | $\mathrm{pH}_{\text {s }}$ | $\begin{array}{\|c} \mathbf{E C}_{\mathbf{e}} \\ \left(\mathrm{dSS}^{-1}\right) \end{array}$ | $\begin{gathered} \text { SAR } \\ \left(\mathrm{mmol} \mathrm{~L}^{-1}\right)^{1 / 2} \end{gathered}$ |
| :---: | :---: | :---: | :---: |
| Removal of crop residue | 8.79 | 4.91 | 31.63 |
| Incorporation of crop residue by disc harrow and MB plough | 8.76 | 4.76 | 31.34 |
| Incorporation of crop residue by disc harrow and MB plough + Urea @ $40 \mathrm{~kg} \mathrm{ha}^{-1}$ for decomposition | 8.76 | 4.71 | 31.06 |
| Incorporation of crop residue by straw chopper | 8.75 | 4.74 | 31.12 |
| Incorporation of crop residue by straw chopper + Urea @ 40 kg ha ${ }^{-1}$ for decomposition | 8.74 | 4.70 | 30.87 |

After the harvest of rice crop soil samples were collected to analyze the soil $\mathrm{EC}_{\mathrm{e}}, \mathrm{pH}_{\mathrm{s}}$ and SAR as shown in table 82. Results indicated that salinity / sodicity parameters have been reduced slightly.

In Rabi season wheat crop was sown on $4^{\text {th }}$ December, 2019 and recommended dose of fertilizer for wheat $120-110-70$ NPK $\mathrm{kg} \mathrm{ha}^{-1}$ was applied. Wheat grain yield data was recorded on $5^{\text {th }}$ May, 2020 as shown in table 83.

Table 84: Effect of crop residue management techniques on Wheat Grain Yield

| Treatments | Wheat Grain Yield <br> $\left(\mathbf{t ~ h a}^{-1}\right)$ |
| :--- | :---: |
| Removal of crop residue | 2.28 C |
| Incorporation of crop residue by disc harrow and MB plough | 2.39 BC |
| Incorporation of crop residue by disc harrow and MB plough + Urea <br> $@, 40 \mathrm{~kg} \mathrm{ha}^{-1}$ for decomposition | 2.58 AB |
| Incorporation of crop residue by straw chopper | 2.53 AB |
| Incorporation of crop residue by straw chopper + Urea @ $40 \mathrm{~kg} \mathrm{ha}^{-1}$ <br> for decomposition | 2.70 A |

Results showed that maximum wheat grain yield $\left(2.70 \mathrm{t} \mathrm{ha}^{-1}\right)$ was recorded where incorporation of crop residue was done by straw chopper + Urea @ $40 \mathrm{~kg} \mathrm{ha}^{-1}$ which remained statistically significant with other crop residue management techniques. Whereas, minimum wheat grain yield ( $2.28 \mathrm{tha} \mathrm{ha}^{-1}$ ) was recorded in removal of crop residue treatment (Table 84).

Table 85: Soil analysis after harvest of wheat crop

| Treatments | $\mathbf{p H}_{\mathbf{s}}$ | $\mathbf{E C}_{\mathbf{e}}$ <br> $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ | SAR <br> $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ |
| :--- | :---: | :---: | :---: |
| Removal of crop residue | 8.78 | 4.88 | 31.44 |
| Incorporation of crop residue by disc harrow and MB plough | 8.75 | 4.71 | 30.91 |
| Incorporation of crop residue by disc harrow and MB plough + | 8.74 | 4.62 | 30.29 |
| Urea @ $40 \mathrm{~kg} \mathrm{ha}^{-1}$ for decomposition | 8.74 | 4.67 | 30.62 |
| Incorporation of crop residue by straw chopper | 8.71 | 4.59 | 29.87 |
| Incorporation of crop residue by straw chopper + Urea @ 40 kg <br> ha $^{-1}$ for decomposition |  |  |  |

After the harvest of wheat crop soil samples were collected to analyze the soil $\mathrm{EC}_{\mathrm{e}}, \mathrm{pH}_{\mathrm{s}}$ and SAR as shown in table 85 . Results indicated that salinity / sodicity parameters have been reduced slightly.

### 5.7 ECONOMIC BOTANY DIVISION

## 32. MAINTENANCE OF RICE GERM PLASM/ GENEPOOL.

The experiment was designed to preserve the genetic stock/genepool for future breeding programme. Forty-four rice varieties/lines were transplanted keeping net plot size of $5 \mathrm{~m} \times 0.25 \mathrm{~m}$. The nursery was transplanted on 11.07.2019 and crop was harvested on 23.10.2019. Recommended dose of fertilizer @ $150-90-60 \mathrm{NPK} \mathrm{kg} \mathrm{ha}^{-1}$ was applied to trial plots. During the crop season off type plants were roughed out to maintain the purity. At maturity the seed of these 44 lines was harvested and preserved for next season.

## 33. HYBRIDIZATION FOR EVOLUTION OF EXTRA LONG GRAIN RICE VARIETIES TOLERANT TO SALINITY

The experiment was designed to create genetic variability for the evolution of salt tolerant rice varieties. The nursery was raised in normal soil at two different dates keeping the interval of fifteen days to synchronize the flowering and transplanted in normal soil. The recommended dose of NPK (150-90-60) $\mathrm{kg} \mathrm{ha}{ }^{-1}$ fertilizer was applied. Fifty different cross combinations were attempted and at maturity fourteen successful cross combinations were harvested and preserved for raising $\mathrm{F}_{1}$ generation in next year.

## 34. EVALUATION OF $\mathrm{F}_{1}$ GENERATION

The experiment was conducted to produce seed for raising $F_{2}$ generation. The $F_{1}$ seed of 25 crosses was soaked and got germinated in petri dishes and then was shifted in the earthen pots. The nursery from earthen pots was translated in normal soil. The plot size was kept according to availability of nursery. The
recommended dose of NPK fertilizer ( $150-90-60$ ) $\mathrm{kg} \mathrm{ha}^{-1}$ was applied. The seed of nine cross combinations was harvested and preserved for evaluation in $\mathrm{F}_{2}$ generation.

## 35. YIELD EVUALTION OF ADVANCE RICE VARIETIES/LINES IN SALT AFFECETED SOIL

The experiment was conducted to compare the yield performance of different advance lines/varieties rice in saline sodic field. The trial was laid out according to randomized complete block design with three replications having a plot size of $5 \mathrm{~m} \times 3 \mathrm{~m}$. The nursery was raised in normal soil and transplanted on 09.07.2019 and crop was harvested on 20.10.2019. Recommended dose of fertilizer @ $150-90-60 \mathrm{NPK} \mathrm{kg} \mathrm{ha}^{-1}$ was applied. The yield performance of these lines/varieties are presented in table 86 below.

Table 86: Paddy yield of advance rice varieties/lines

| Sr\# | Name of entry | Yield $\left(\mathbf{t ~ h a}{ }^{-\mathbf{1}} \mathbf{)}\right.$ |
| :--- | :--- | :--- |
| 1 | SRI-23 | 2.93 A |
| 2 | SRI-25 | 2.91 A |
| 3 | SRI-22 | 2.68 B |
| 4 | SRI-24 | 2.57 B |
| 5 | SRI-26 | 2.39 C |
| 6 | Shaheen Basmati | 2.38 C |
| 7 | SRI-27 | 2.37 C |
| 8 | SRI-28 | 2.20 D |
| 9 | SRI-29 | 2.11 DE |
| 10 | SRI-30 | 2.08 DEF |
| 11 | SRI-31 | 2.05 EFG |
| 12 | SRI-32 | 2.01 EFGH |
| 13 | SRI-33 | 1.98 FGHI |
| 14 | SRI-34 | 1.94 GHI |
| 15 | SRI-35 | 1.90 HI |
| 16 | SRI-36 | 1.89 HI |
| 17 | Chenab Basmati | 1.88 I |
| 18 | PS-02 | 1.87 I |
| 19 | Noor Basmati | 1.61 J |
|  | LSD | 0.1251 |

Results (Table 86) showed that highest paddy yield ( $2.93 \mathrm{t} \mathrm{ha}^{-1}$ ) was produced by advance line SRI-23 that was statistically at par with SRI-25 ( $2.91 \mathrm{t} \mathrm{ha}^{-1}$ ) whereas the lowest paddy yield ( $1.61 \mathrm{t} \mathrm{ha}^{-1}$ ) was recorded in Noor Basmati on salt affected soil.

## Initial soil analyses

$\mathrm{pH}_{\mathrm{s}} 8.65$
$\mathrm{EC}_{\mathrm{e}} 5.67 \mathrm{dS} \mathrm{m}^{-1}$
SAR $35.29\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$

Post-harvest soil analyses
$\mathrm{pH}_{\mathrm{s}} 8.60$
$\mathrm{EC}_{\mathrm{e}} 5.42 \mathrm{dS} \mathrm{m}^{-1}$
SAR $33.24\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$

## 36. ADAPTABILITY STUDY OF NEW SALT TOLERANT RICE LINES AT DIFFERENT LOCATIONS

This experiment was planned to find out the yield performance of new rice lines under different locations. The nursery was transplanted in normal field at different locations and crop harvested on different dates during the season. The recommended dose of NPK (150-90-60) $\mathrm{kg} \mathrm{ha}^{-1}$ fertilizer was applied. The experiment was laid out according to RCBD having net plot size of $5 \mathrm{~m} \times 3 \mathrm{~m}$. The recommended cultural practices were carried out till maturity. At maturity yield and yield components data were recorded. Paddy yield data of all six locations are given in table 87.

Table 87: Paddy yield of rice at different locations

| Sr <br> .\# | Name of <br> variety | Location wise Paddy Yield t ha $^{-1}$ |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Sargodha | Gujranwala | Pindi <br> Bhattian | Faisalabad | Multan | Farooqabad | Avg. |  |
|  | SRI-23 | 3.61 A | 4.36 A | 4.44 A | 3.83 A | 3.45 AB | 4.69 A | 4.06 |
| 2 | SRI-24 | 2.78 DE | 4.08 AB | 3.04 BCD | 2.81 E | 3.66 A | 4.28 BC | 3.44 |
| 3 | SRI-25 | 3.32 B | 4.12 AB | 4.21 A | 3.65 AB | 3.24 BC | 4.54 AB | 3.84 |
| 4 | SRI-26 | 2.92 CD | 4.09 AB | 2.98 BCD | 2.97 DE | 2.87 C | 4.11 C | 3.32 |
| 5 | SRI-27 | 2.56 F | 3.11 D | 2.83 CD | 3.18 CD | 3.15 BC | 3.02 F | 2.97 |
| 6 | SRI-28 | 3.22 B | 3.49 C | 2.94 BCD | 3.44 BC | 2.97 C | 4.04 CD | 3.35 |
| 7 | SRI-29 | 2.36 G | 3.16 D | 3.27 B | 3.29 C | 3.25 BC | 4.25 C | 3.26 |
| 8 | SRI-30 | 2.83 CDE | 3.51 C | 2.75 D | 2.91 DE | 2.95 C | 3.37 E | 3.05 |
| 9 | Shaheen | 2.95 C | 4.01 B | 3.21 CD | 2.72 E | 2.24 D | 3.52 E | 3.10 |
| 10 | Chenab | 2.13 H | 4.25 AB | 3.13 BC | 3.15 CD | 2.03 D | 3.41 E | 3.01 |
| 11 | PS-02 | 2.74 E | 3.65 C | 2.94 BCD | 2.01 F | 1.96 D | 3.82 D | 2.85 |
|  | LSD | 0.1700 | 0.2980 | 0.3704 | 0.2914 | 0.3955 | 0.2897 |  |

Five lines out yielded all the check varieties on an average basis for six locations. The maximum average yield of $4.06 \mathrm{t} / \mathrm{ha}$ was produced by the line SRI-23 followed by SRI-25 ( $3.84 \mathrm{t} \mathrm{ha}{ }^{-1}$ ) SRI24 (3.44 tha ${ }^{-1}$ ) SRI-28 (3.35 tha ${ }^{-1}$ ), SRI-26 (3.32 tha ${ }^{-1}$ ) and SRI-29 ( $3.26 \mathrm{tha}^{-1}$ ) against the check varieties Shaheen Basmati ( $3.10 \mathrm{tha} \mathrm{ha}^{-1}$ ), Chenab Basmati ( 3.01 tha ) and PS-02 ( 2.85 t ha ${ }^{1}$ ) respectively (Table 87).

## 37. SCREENING OF 20 RICE VARITIES/LINES COLLECTED FROM DIFFERENT INSTITUTES

The experiment was conducted to screen out various rice lines against salinity/sodicity. The trial was conducted in developed artificial salinity levels of $\mathrm{EC}_{\mathrm{e}} 4,6,8$ and $10 \mathrm{dS} \mathrm{m}^{-1}$ along with sodicity levels of SAR $15,25,30$ and $35\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$ by adding salts i.e. $\mathrm{NaCl}, \mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}$ in cemented blocks. The nursery of 20 advanced lines/varieties was transplanted on 11-07-2019 keeping net plot size of $5 \mathrm{~m} \times 0.25 \mathrm{~m}$. Recommended dose of fertilizer ( $150-90-60 \mathrm{NPK} \mathrm{kg} \mathrm{ha}$ ) was applied. At maturity crop was harvested on 12-11-2019. Yield data recorded are given below in table 88:

Table 88: Paddy yield under saline sodic soil

| Sr. <br> No. | Name of line/ variety | Initial Soil Analyses of salinity blocks |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

|  |  | Post-harvest Soil Analyses of salinity blocks |  |  |  |
|  |  | $\begin{aligned} & \mathrm{EC}_{\mathrm{e}} 2.45 \\ & \left(\mathrm{dS} \mathrm{~m}^{-1}\right) \\ & \text { SAR } 10.27_{\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}} \end{aligned}$ | $\mathrm{EC}_{\mathrm{e}} 5.58$ <br> $(\mathrm{dS} \mathrm{m}$ <br> m <br> SAR 20.19 <br> $\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}$ | $\mathrm{EC}_{\mathrm{e}} 7.51$ $\left(\mathrm{dS} \mathrm{m}^{-1}\right)$ $\mathrm{SAR} \mathrm{27.38}$ $\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}$ | $\begin{aligned} & \mathrm{EC}_{\mathrm{e}} 9.39 \\ & (\mathrm{dS} \mathrm{~m} \\ & \text { SAR 32.23 } \\ & \left(\mathrm{mmolL}^{-1}\right)^{1 / 2} \end{aligned}$ |

The rice lines SRI-23 (27.20, 24.12, 22 \& $16 \mathrm{~g} /$ plant) and SRI-25 (26.07, 23.15, $18.80 \& 14.08$ $\mathrm{g} /$ plant) performed best at all salinity levels.

## 38. NATIONAL UNIFORM RICE YIELD TRIAL

The experiment was arranged to compare the adoptability and yield performance of rice lines in saline sodic field. The trial was laid out in randomized complete block design with three replications keeping net plot size of $5 \mathrm{~m} \times 3 \mathrm{~m}$. The nursery was transplanted on 16.07 .2019 and crop was harvested on 26.10.2019. Recommended dose of fertilizer @ $150-90-60$ NPK kg ha ${ }^{-1}$ was applied. Paddy yield data recorded are presented in table 89 \& table 90 below.

Table 89: Paddy yield under saline sodic soil

| Fine Rice |  |  |  |

| 24 | RC-19157 | 1739 | P |
|  | LSD | $\mathbf{1 5 . 0 5 2}$ |  |

Results presented in table 90 showed that highest paddy yield $3109 \mathrm{~kg} \mathrm{ha}^{-1}$ was produced by advance line RC-19181, that is statistically at par with RC-19159 (3102 $\mathrm{kg} \mathrm{ha}^{-1}$ ), RC-19185 (3101 kg ha${ }^{1}$ ) \& RC-19175 (3098 $\mathrm{kg} \mathrm{ha}^{-1}$ ) whereas the lowest paddy yield of $1739 \mathrm{~kg} \mathrm{ha}^{-1}$ was recorded in RC-19157 on salt affected soil.

## Initial soil analyses

$\mathrm{pH}_{\mathrm{s}}$ 8.70-8.95
$\mathrm{EC}_{\mathrm{e}} 4.55-5.67 \mathrm{dS} \mathrm{m}^{-1}$
SAR 33.24-37.59 $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$

## Post-harvest soil analyses

$\mathrm{pH}_{\mathrm{s}}$ 8.63-8.89
$\mathrm{EC}_{\mathrm{e}} 4.49-5.60 \mathrm{dS} \mathrm{m}{ }^{-1}$
SAR 31.76-36.08 $\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$

## 39. PRE-BASIC SEED PRODUCTION OF SHAHEEN BASMATI

The experiment was laid out for the production of pre-basic seed of approved variety Shaheen Basmati. Forty panicles of selected plants from Shaheen Basmati were grown in plant to row progenies. Nine uniform progeny lines were selected to develop individual progeny blocks. Five most uniform progeny blocks were also selected and bulked to produce seed. Six kg BNS and Eighty kg pre-basic seed of Shaheen Basmati was produced.

## 40. MAINTENANCE OF WHEAT GERMPLASM / GENEPOOL

The experiment was conducted to preserve the genetic stock/genepool for future breeding programme. These varieties/genotypes were grown in normal soil keeping plot size of $5 \mathrm{~m} \times 3 \mathrm{~m}$. The experiment was planted 28.11.2019 and harvested on 20.04.2020. Following genotypes are maintained under this experiment.

## 41. YIELD TRIAL OF PROMISING WHEAT LINES/VARIETIES

The experiment was designed to see the performance and yield potential of promising lines of wheat in saline sodic soil. The experiment was laid out in a saline sodic field according to randomize complete block design with three replications by keeping the plot size 5 mx 2.5 m . Recommended dose of fertilizer (120-110-70) NPK $\mathrm{kg} \mathrm{ha}^{-1}$ ) was applied. The experiment was planted 30.11.2019 and harvested on 02.05.2020. Grain yield data recorded is presented in table 91 below.

Table 91: Grain yield in moderately saline sodic soil

| Sr.No | Name of varieties/lines | $\begin{gathered} \text { Grain Yield } \\ \left(\mathbf{t} \mathbf{h a}^{-1}\right) \end{gathered}$ |
| :---: | :---: | :---: |

| 14 | Gold | 1.87 FG |
| 15 | Johar-16 | 1.78 G |
|  | LSD | 0.2105 |

The results (Table 91) indicated that the highest grain yield of 2.73 t ha - was recorded in advance line $14 \mathrm{~S}_{1} \mathrm{P}_{1}$ that was statistically at par with Faisalabad-2008 ( $2.53 \mathrm{t} \mathrm{ha}{ }^{-1}$ ) and the lowest grain yield was produced by Johar-16 that $1.78 \mathrm{tha}^{-1}$.

## Initial soil analyses

$\mathrm{pH}_{\mathrm{s}} 8.25$
$\mathrm{EC}_{\mathrm{e}} 6.39 \mathrm{dS} \mathrm{m}^{-1}$
SAR $28.13\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$

## Post-harvest soil analyses

pH 8.21
$\mathrm{EC}_{\mathrm{e}} 6.22 \mathrm{dS} \mathrm{m}^{-1}$
SAR $26.45\left(\mathrm{mmol} \mathrm{L}^{-1}\right)^{1 / 2}$
42. SCREENING OF TWENTY WHEAT VARIETIES/LINES COLLECTED FROM DIFFERENT INSTITUTES UNDER CONTROLLED CONDITION FOR SALT TOLERANCE

The experiment was designed to find out suitable lines/varieties of wheat having better yield potential under controlled salinity levels in artificially constructed cemented blocks. The salinity levels were maintained by adding salts i.e. $\mathrm{NaCl}, \mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{CaCl}_{2}$ and $\mathrm{MgSO}_{4}$. A single row of each variety/line was sown at each salinity level keeping net plot size of $5 \mathrm{~m} \times 0.20 \mathrm{~m}$.

Recommended dose of fertilizer (120-110-70 NPK kg ha ${ }^{-1}$ ) was applied. The experiment was planted 27.11.2019 and harvested on 20.04.2020. The of grain yield are presented in table 92.

Table 92: Grain yield in salinity blocks

| Sr. No. | Entry Name | Initial Soil Analyses of salinity blocks |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{array}{\|l} \hline \mathrm{EC}_{\mathrm{e}} 3.41 \\ (\mathrm{dS} \mathrm{~m} \\ \left.\mathrm{m}^{-1}\right) \\ \text { SAR 13.68 } \\ \left(\mathrm{mmolL}^{-1}\right)^{1 / 2} \\ \hline \end{array}$ | $\begin{aligned} & \hline \mathrm{EC}_{\mathrm{e}} 7.34 \\ & (\mathrm{dS} \mathrm{~m} \\ & \text { ( } \left.{ }^{-1}\right) \\ & \text { SAR 24.59 } \\ & \left(\mathrm{mmolL}^{-1}\right)^{1 / 2} \\ & \hline \end{aligned}$ | $\begin{aligned} & \hline \mathrm{EC}_{\mathrm{e}} 11.78 \\ & \left(\mathrm{dS} \mathrm{~m}^{-1}\right) \\ & \text { SAR 33.21 }^{\left(\mathrm{mmolL}^{-1}\right)^{1 / 2}} \\ & \hline \end{aligned}$ | $\left.\begin{array}{\|l} \hline \text { EC }_{\mathrm{e}} 15.72 \\ (\mathrm{dS} \mathrm{~m} \end{array}\right)$ |

The results (Table 100) indicate that five lines $18 \mathrm{C} 124,18 \mathrm{C} 125,18 \mathrm{C} 116,18 \mathrm{C} 122$ and $\mathrm{CH}-50$ produced better grain yield than other at all salinity levels.

## 43. EVALUATION OF NUYT WHEAT LINES UNDER SALT AFFECTED SOIL

The experiment was conducted to evaluate the yield and test adaptability of most promising wheat lines evolved by the National Wheat Research Organizations. The trial was laid out in RCBD with two replications keeping plot size $5 \mathrm{~m} \times 1.15 \mathrm{~m}$. The saline-sodic field having pHs 8.64-8.76 ECe 5.15-5.98 dS $\mathrm{m}^{-1}$ SAR 26.09-37.12 ( mmol L$)^{-1}$ ) $1 / 2$ was selected. Recommended dose of fertilizer (120-110-700) NPK $\mathrm{kg} / \mathrm{ha}$ was used. Sixty entries were tested. All kind of recommended agronomic practices ware followed. The experiment was planted 29.11.2019 and harvested on 02.05.2020. The yeild data are given in table 93.
